960CH TFT LCD Source Driver  
with TCON

*Preliminary version 04 February, 2007*

## 1. General Description

HX8250-A is a 960-channel outputs source driver with TCON, OSD mixer, and 3-wire Serial Port Interface. It also supports 2-chip cascade mode to extend source channel to be 1920 channels.

The interface follows digital 8-bit serial/24-bit parallel RGB, CCIR601 and CCIR656 input format. The TCON generates the 960x240, 1920x240, and 1920x480 resolution and provides horizontal and vertical control timing to source driver and gate driver. It also supports dithering feature, apply source driver with 6-bit DAC to perform 8-bit resolution 256 gray scales.

The source driver receives 6-bit by 3 dots of digital display data per clock from TCON and generates corresponding 64-level gray scale voltage output. Since the output circuit of this source driver incorporates an operational amplifier with low power dissipation, and performs wide voltage supply range and small output deviation. Therefore, a high quality display with less crosstalk can be achieved.

## 2. Features

### TCON

- | Support display resolution 960x240, 1920x240, and 1920x480
- | Support digital 8-bit serial RGB, CCIR601, and CCIR656 input mode
- | Support digital 24-bit parallel RGB input mode
- | Internal dithering 8-bit data to 6-bit data for Source Driver Circuit
- | Only support stripe types of panel group
- | Operation frequency: 40 MHz max
- | Support NTSC/PAL TV system
- | OSD overlay supported in CCIR601and CCIR656 input mode
- | Provide source and gate drivers control timing
- | Provide flip and mirror scan control
- | Operation Voltage Level 2.7V to 3.6V

### Source Driver

- | 960 channels output source driver for TFT LCD panel
- | Dynamic output range: 0.1 to VDD-0.1V
- | Voltage deviation of outputs:  $\pm 20\text{mV}$
- | Dot inversion driving scheme
- | Right and left shift capability
- | LCD power: 6.5 to 13.5V

### Others

- | COG package

- Note:** (1) Please power on following the sequence VCC → logic input → VDD and V1 ~ V10. Reverse the sequence to shut down.
- (2) To stabilize the supply voltages, please be sure to insert a 0.1uF bypass capacitor between VCC-GND and VDD-VSS. Furthermore, for increased precision of the D/A converter, insertion of a bypass capacitor of about 0.01uF is also advised between the gamma-corrected power supply terminals (V1, V2, ..., V10) and VSS.
- (3) Please keep V1~V10 not cross to the toggle signals as possible to avoid the AC coupling on the DC V1~V10 voltage. When used as cascade mode, please keep the coupled amount of V1~V10 are the same between the two chip.
- (4) The input wiring resistance values affect power or signal integrity and the display quality. So be sure to design using values that do not exceed those recommended as below.

### 5.2 HX8250-A chip locations with LR and UD control

HX8250-A can be controlled Left/Right shift and Up/Down scan by LR and UD pins. The setting depends on HX8250-A and Gate Driver positions with panel. Please reference to below diagram to set the LR and UD.

### 5.3 Digital RGB data input format

For digital RGB input data format, both SYNC mode and DE mode are supported. HX8250-A will auto detect which mode is used. If DEN signal is fixed low, SYNC mode is used. Otherwise, DE mode is used. The OSD function is not supported in digital serial/parallel RGB mode.

### 5.4 NTSC/PAL mode auto detection

For NTSC/PAL mode setting, the auto-detection function is implemented. You don't have to define this setting and can use NPC pin to monitor detection result.

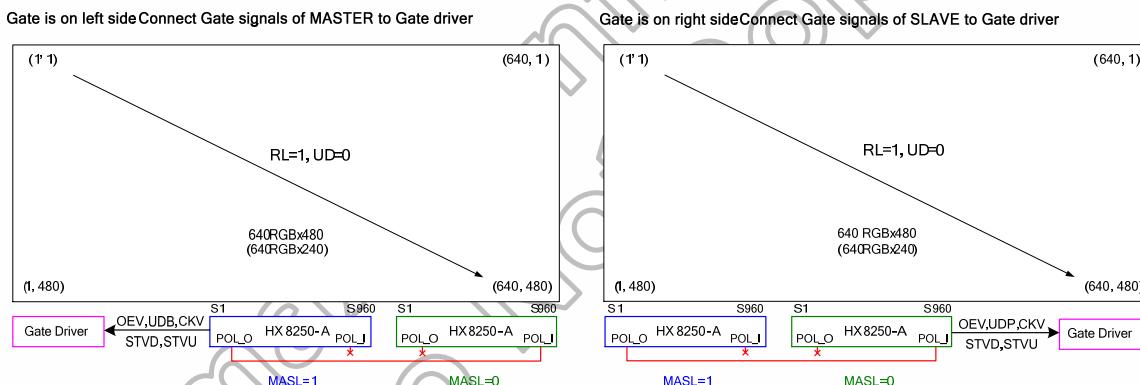

## 5.5 Cascade mode for 1920x240, 1920x480 resolutions

HX8250-A supports 1920x240 and 1920x480 resolutions by cascade 2 chips. When connect to cascade mode, user need to set MASL pin to define which chip is master mode or slave mode. Master chip and slave chip are decided by the fixed position. Always master chip's SO960 is neighbor to slave chip's SO1.

It needs to receive the polarity signal from the master chip for the polarity synchronized. Please always connect POL\_O of Master chip to POL\_I of Slave chip. POL\_I of Master chip and POL\_O of Slave chip could keep NC. Please reference to the following diagrams.

Signals to gate driver could be provided by master chip or slave chip. Each side of master chip or slave chip could provide the gate signals, and user can chooses the closer side to connect with gate driver.

Please minimize the parasitic R of the POL path. The parasitic R should be smaller than 200 ohm.

## 5.6 Relationship between gamma correction and output voltage

The output voltage is determined by the 6-bit digital input data, and the V1 ~ V10 gamma correction reference voltage inputs.

Gamma correction characteristic curve:

Table 5. 2 Register R0 setting

PSC: Operating mode setting by input pin or SPI register.

PSC="L", set STB, FRP, CS, IF[2:0], RESL[1:0] by input pin.

PSC="H", set STB, FRP, CS, IF[2:0], RESL[1:0] by SPI register.

STB: Standby mode setting.

STB="L", TCON and source driver are off.

STB="H", all the functions are on.

RESETB: Global reset.

RESETB="L", global reset the whole chip.

RESETB="H" Normal operation.

LPF: Low pass filter function enable/disable in CCIR656/CCIR601 mode

LPF="L", Low pass filer function disable

LPF="H", Low pass filer function enable

VS\_POL: VS polarity setting.

VS\_POL=L, negative polarity.

VS\_POL=H, positive polarity.

**Note:** Please set the VS\_POL=H when CCIR601 mode for video decoder SAA7114.

(Please refer the input timing of the "8.1.3 Data input format for CCIR601 Mode")

HS\_POL: HS polarity setting.

HS\_POL=L, negative polarity.

HS\_POL=H, positive polarity.

NPC\_SET: Set the NTSC/PAL auto detection or define by NPC\_IN.

NPC\_SET=L, auto detection.

NPC\_SET=H, define by NPC\_IN.

NPC\_IN: Define the NTSC/PAL mode by SPI.

NPC\_IN=L, PAL.

NPC\_IN=H, NTSC.

**Table 5. 12 Register R5 setting**

AUTO\_DP: When power on, select blank image display time decided by A\_TIME (bit 5, 4) or DISP\_ON (bit 6).

AUTO\_DP = "L", Blank image display time decided by DISP\_ON (bit 6).

AUTO\_DP = "H", Blank image display time decided by A\_TIME(bit 5, 4).

DISP\_ON: When AUTO\_DP (bit 7) = "L", and DISP\_ON = "H", blank image display off, then display normal image.

A\_TIME [1:0]: When AUTO\_DP(bit 7) = "H", the blank image display time is decided by A\_TIME

00: blank image display time is 8 VS time.

01: blank image display time is 16 VS time.

10: blank image display time is 32 VS time.

11: blank image display time is 64 VS time.

B\_TIME [2:0]: When into STB mode, the blank image display time is decided by B\_TIME.

000: blank image display time is 3 VS time.

001: blank image display time is 4 VS time.

010: blank image display time is 5 VS time.

011: blank image display time is 6 VS time.

100: blank image display time is 7 VS time.

101: blank image display time is 8 VS time.

110: blank image display time is 9 VS time.

111: blank image display time is 10 VS time.

## 5.8 Power ON/OFF sequence

To prevent the device damage from latch up, the power ON/OFF sequence shown below must be followed.

Power ON: VCC, GND → VDD, VSS → V1 to V10

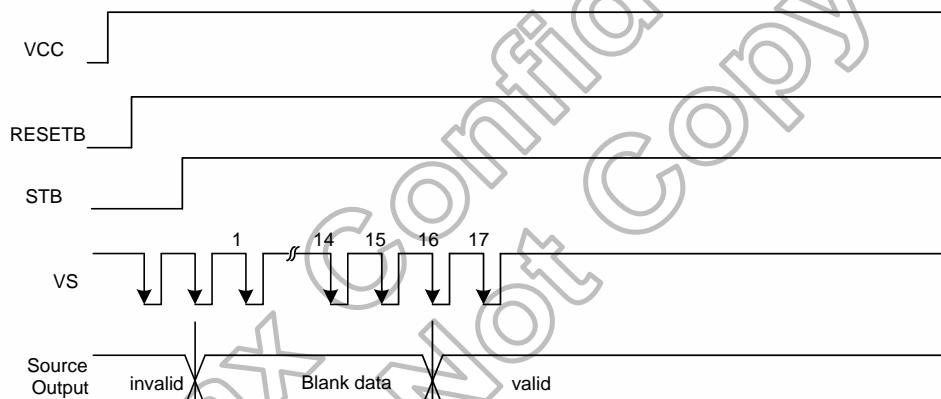

Power OFF: V1 to V10 → VDD, VSS → VCC, GND

## 5.9 Power ON Control

HX8250-A has a power ON sequence control function. There are two kinds of the mode. One is auto mode, and another is manual mode.

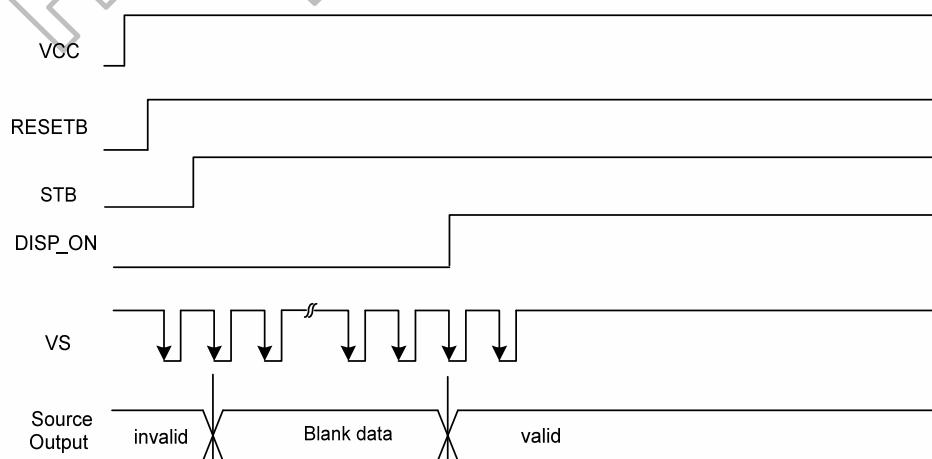

**Auto Mode:** When power is ON, blank data is outputted for 16-frames (default value) first, from the falling edge of the following VS signal. The blank data would be gray level 255 for normally white panel.

It can be defined in register R5 A\_TIME1(bit 5) and A\_TIME0(bit 4) when AUTO\_DP(bit 7) = "H"

**Figure 5.7 Power on control for Auto Mode**

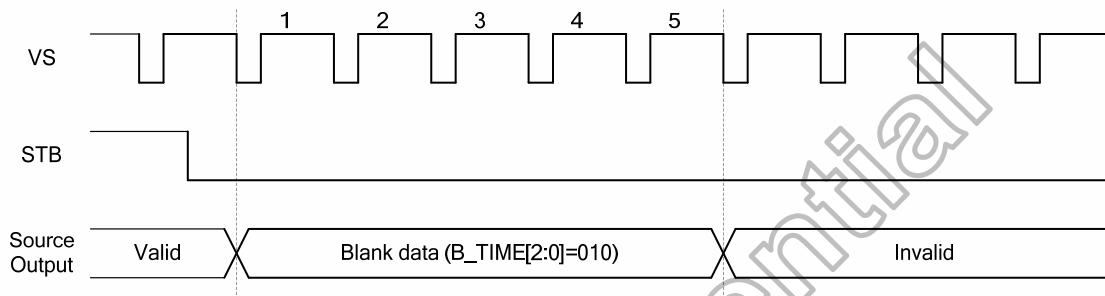

**Manual Mode:** When power is ON, you should set the register R5 AUTO\_DP(bit 7) = "L" to stay at the manual mode. Blank data is outputted until the DISP\_ON(bit 6) = H then display the normal image.

**Figure 5.8 Power on control for Manual Mode**

## 5.10 Standby ON/OFF Control

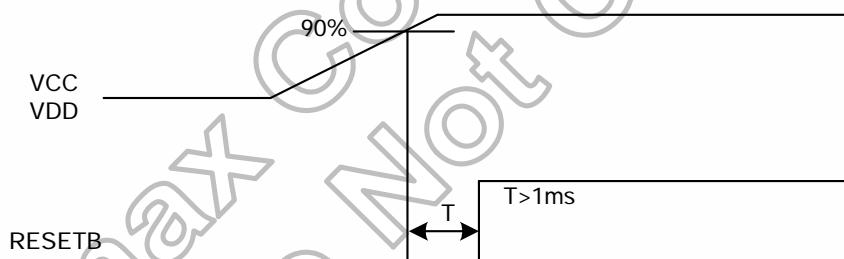

HX8250-A has a standby ON/OFF sequence control function. When STB pin is “L”, blank data is outputted for 5-frames (default value) first, from the falling edge of the following VSYNC signal. The blank data would be gray level 255 for normally white panel. It can be defined in register R5 B\_TIME[2:0] to adjust the frame number of the blank data.

**Figure 5. 9 Standby ON/OFF Control**

## 5.11 Reset when power on

HX8250-A is internally initialized by the global reset signal, RESETB. The reset input must be held for at least 1ms after power is stable.

**Figure 5. 10 RESETB control after power stable**
