SSD1305

Advance Information

132 x 64 Dot Matrix
OLED/PLED Segment/Common Driver with Controller

CONTENTS

TABLES

FIGURES

1 GENERAL DESCRIPTION

The SSD1305 is a CMOS OLED/PLED driver with controller for organic/polymer light emitting diode dot-matrix graphic display system. It consists of 132 segments and 64 commons that can support a maximum display resolution of 132x64. There are 4-color selections to support monochrome or area color OLED/PLED. This IC is designed for Common Cathode type OLED panel.

The SSD1305 embeds with contrast control, display RAM and oscillator, which reduces the number of external components and power consumption. It has 256-step brightness control and separate power for I/O interface logic. It is suitable for many compact portable applications, such as mobile phone sub-display, calculator and MP3 player, etc.

2 FEATURES

- Resolution: 132 x 64 dot matrix panel
- Area color support with 4 Color Selection and 64 steps per color
- Power supply:
  - V_{DD} = 2.4V to 3.5V for IC logic
  - V_{CC} = 7.0V to 15.0V for Panel driving
  - V_{DDIO} = 1.6V to V_{DD} for MCU interface
- Segment maximum source current: 320uA
- Common maximum sink current: 45mA
- Embedded 132 x 64 bit SRAM display buffer
- 256-step Contrast Control
- 8-bit 6800-series Parallel Interface, 8-bit 8080-series Parallel Interface, Serial Peripheral Interface, I^2C Interface
- Row Re-mapping and Column Re-mapping
- Continuous Horizontal, Vertical and Diagonal Scrolling
- Dim Mode operations
- Programmable Frame Frequency and Multiplexing Ratio
- On-Chip Oscillator
- Low power consumption
- Wide range of operating temperatures: -40 to 85 °C

3 ORDERING INFORMATION

Table 3-1 : Ordering Information

Ordering Part Number	SEG	COM	Package Form	Reference	Remark
SSD1305Z	132	64	Gold Bump Die	Page 9, 65	• Min SEG pad pitch: 52um • Min COM pad pitch: 45um
SSD1305T6R1	132	64	TAB	Page 12 ,66	• 35mm film, 4 sprocket hole • Folding TAB • 8-bit 80 / 8-bit 68 / SPI / I^2C interface • SEG lead pitch 0.120mm x 0.998 =0.11976mm • COM lead pitch 0.120mm x 0.998 =0.11976mm
SSD1305T7R1	132	64	TAB	Page 14, 68	• 35mm film, 4 sprocket hole • Folding TAB • 8-bit 80 / 8-bit 68 / SPI / I^2C interface • SEG lead pitch 0.120mm x 0.998 =0.11976mm • COM lead pitch 0.120mm x 0.998 =0.11976mm

7 PIN DESCRIPTION

Key: I = Input, O =Output, IO = Bi-directional (input/output), P = Power pin

Table 7-1 : Pin Description

Pin Name	Pin Type	Description
V_{DD}	P	Power supply pin for core logic operation.
V_{DDIO}	P	Power supply for interface logic level. It should be match with MCU interface voltage level. V_{DDIO} must always be equal or lower than V_{DD}.
V_{CC}	P	Power supply for panel driving voltage. This is also the most positive power voltage supply pin.
V_{SS}	P	This is a ground pin.
V_{LSS}	P	This is an analog ground pin. It should be connected to V_{SS} externally.
V_{COMH}	O	The pin for COM signal deselected voltage level. A capacitor should be connected between this pin and V_{SS}.
BGGND	P	This pin must be connected to ground.
V_{DDB}	P	This is a reserved pin. It must be connected to V_{DD}.
V_{SSB}	P	This is a reserved pin. It must be connected to V_{SS}.
GDR	O	This is a reserved pin. It should be kept NC (i.e. Float during normal operation).
FB	I	This is a reserved pin. It should be kept NC (i.e. Float during normal operation).
V_{BREF}	P	This is a reserved pin. It should be kept NC (i.e. Float during normal operation).
V_{CIR}	O	This is a reserved pin. It should be kept NC (i.e. Float during normal operation).
BS[2:0]	I	MCU bus interface selection pins. Please refer to Table 7-2 for the details of setting.
I_{REF}	I	This is segment output current reference pin. A resistor should be connected between this pin and V_{SS} to maintain the I_{REF} current at 10uA. Please refer to Figure 8-18 for the details of resistor value.
FR	O	This pin outputs RAM write synchronization signal. Proper timing between MCU data writing and frame display timing can be achieved to prevent tearing effect. It should be kept NC if it is not used. Please refer to Section 8.4 for details usage.
CL	I	This is external clock input pin. When internal clock is enabled (i.e. HIGH in CLS pin), this pin is not used and should be connected to V_{SS}. When internal clock is disabled (i.e. LOW in CLS pin), this pin is the external clock source input pin.
CLS	I	This is internal clock enable pin. When it is pulled HIGH (i.e. connect to V_{DDIO}), internal clock is enabled. When it is pulled LOW, the internal clock is disabled; an external clock source must be connected to the CL pin for normal operation.
RES#	I	This pin is reset signal input. When the pin is LOW, initialization of the chip is executed. Keep this pin HIGH (i.e. connect to V_{DDIO}) during normal operation.

Pin Name	Pin Type	Description
CS#	I	This pin is the chip select input. (active LOW)
D/C#	I	This is Data/Command control pin. When it is pulled HIGH (i.e. connect to V_{DDIO}), the data at D[7:0] is treated as data. When it is pulled LOW, the data at D[7:0] will be transferred to the command register. In I^2C mode, this pin acts as SA0 for slave address selection. For detail relationship to MCU interface signals, please refer to the Timing Characteristics Diagrams: Figure 13-1 to Figure 13-5.
E (RD#)	I	When interfacing to a 6800-series microprocessor, this pin will be used as the Enable (E) signal. Read/write operation is initiated when this pin is pulled HIGH (i.e. connect to V_{DDIO}) and the chip is selected. When connecting to an 8080-microprocessor, this pin receives the Read (RD#) signal. Read operation is initiated when this pin is pulled LOW and the chip is selected. When serial interface is selected, this pin must be connected to V_{SS}.
R/W#(WR#)	I	This is read / write control input pin connecting to the MCU interface. When interfacing to a 6800-series microprocessor, this pin will be used as Read/Write (R/W#) selection input. Read mode will be carried out when this pin is pulled HIGH (i.e. connect to V_{DDIO}) and write mode when LOW. When 8080 interface mode is selected, this pin will be the Write (WR#) input. Data write operation is initiated when this pin is pulled LOW and the chip is selected. When serial interface is selected, this pin must be connected to V_{SS}.
D[7:0]	IO	These are 8-bit bi-directional data bus to be connected to the microprocessor's data bus. When serial interface mode is selected, D0 will be the serial clock input: SCLK; D1 will be the serial data input: SDIN and D2 should be left opened. When I^2C mode is selected, D2, D1 should be tied together and serve as SDA_{out}, SDA_{in} in application and D0 is the serial clock input, SCL.
TR0-TR11	-	Testing reserved pins. It should be kept NC.
SEG0 ~ SEG131	O	These pins provide Segment switch signals to OLED panel. They are in high impedance stage when display is OFF.
COM0 ~ COM63	O	These pins provide Common switch signals to OLED panel. They are in high impedance state when display is OFF.
NC	-	This is dummy pin. Do not group or short NC pins together.

Table 7-2 : MCU Bus Interface Pin Selection

Pin Name	I^2C Interface	6800-parallel interface (8 bit)	8080-parallel interface (8 bit)	Serial interface
BS0	0	0	0	0
BS1	1	0	1	0
BS2	0	1	1	0

Note
(1) 0 is connected to V_{SS}
(2) 1 is connected to V_{DDIO}

8 FUNCTIONAL BLOCK DESCRIPTIONS

8.1 MCU Interface selection

SSD1305 MCU interface consist of 8 data pins and 5 control pins. The pin assignment at different interface mode is summarized in Table 8-1. Different MCU mode can be set by hardware selection on BS[2:0] pins (please refer to Table 7-2 for BS[2:0] setting).

Table 8-1 : MCU interface assignment under different bus interface mode

Pin Name / Bus Interface	Data/Command Interface								Control Signal				
	D7	**D6**	**D5**	**D4**	**D3**	**D2**	**D1**	**D0**	**E**	**R/W#**	**CS#**	**D/C#**	**RES#**
8-bit 8080	D[7:0]								RD#	WR#	CS#	D/C#	RES#
8-bit 6800	D[7:0]								E	R/W#	CS#	D/C#	RES#
SPI	Tie LOW					NC	SDIN	SCLK	Tie LOW		CS#	D/C#	RES#
I^2C	Tie LOW					SDA_{OUT}	SDA_{IN}	SCL	Tie LOW			SA0	RES#

8.1.1 MCU Parallel 6800-series Interface

The parallel interface consists of 8 bi-directional data pins (D[7:0]), R/W#, D/C#, E and CS#.

A LOW in R/W# indicates WRITE operation and HIGH in R/W# indicates READ operation.
A LOW in D/C# indicates COMMAND read/write and HIGH in D/C# indicates DATA read/write.
The E input serves as data latch signal while CS# is LOW. Data is latched at the falling edge of E signal.

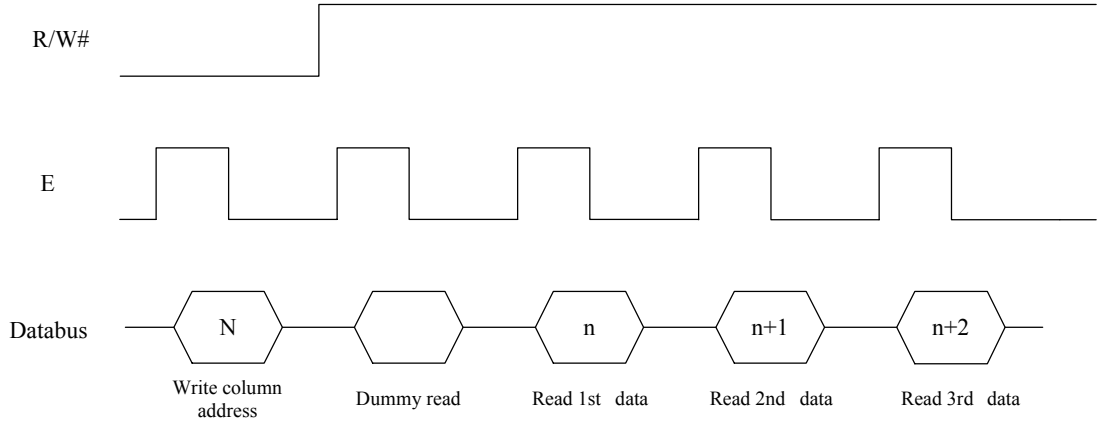
Table 8-2 : Control pins of 6800 interface

Function	E	R/W#	CS#	D/C#
Write command	↓	L	L	L
Read status	↓	H	L	L
Write data	↓	L	L	H
Read data	↓	H	L	H

Note
(1) ↓ stands for falling edge of signal
H stands for HIGH in signal
L stands for LOW in signal

In order to match the operating frequency of display RAM with that of the microprocessor, some pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read. This is shown in Figure 8-1.

Figure 8-1 : Data read back procedure - insertion of dummy read



8.1.2 MCU Parallel 8080-series Interface

The parallel interface consists of 8 bi-directional data pins (D[7:0]), RD#, WR#, D/C# and CS#.

A LOW in D/C# indicates COMMAND read/write and HIGH in D/C# indicates DATA read/write.
A rising edge of RD# input serves as a data READ latch signal while CS# is kept LOW.
A rising edge of WR# input serves as a data/command WRITE latch signal while CS# is kept LOW.

Figure 8-2 : Example of Write procedure in 8080 parallel interface mode

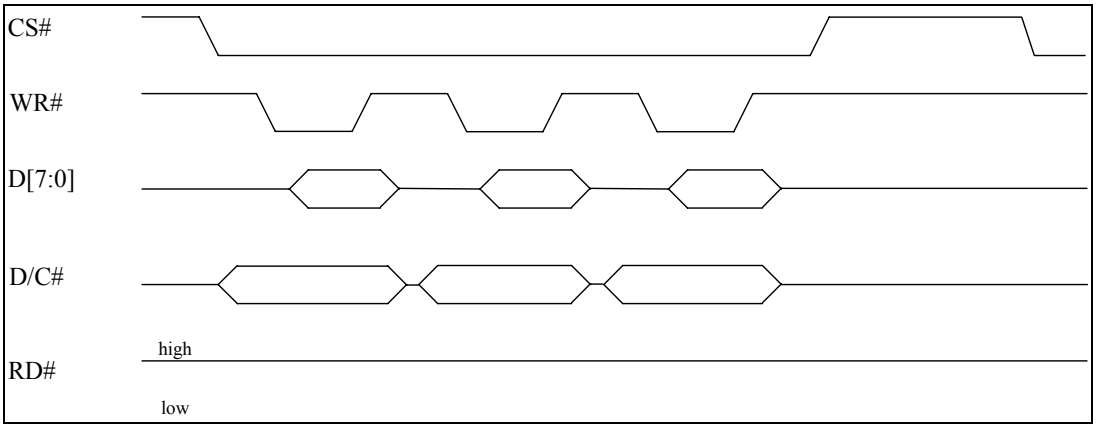


Figure 8-3 : Example of Read procedure in 8080 parallel interface mode

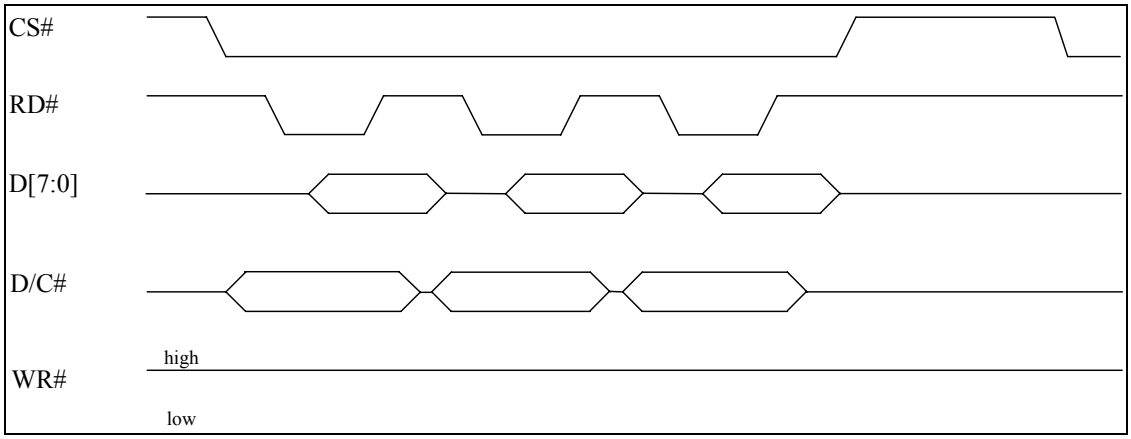

Table 8-3 : Control pins of 8080 interface (Form 1)

Function	RD#	WR#	CS#	D/C#
Write command	H	↑	L	L
Read status	↑	H	L	L
Write data	H	↑	L	H
Read data	↑	H	L	H

Note
(1) ↑ stands for rising edge of signal
(2) H stands for HIGH in signal
(3) L stands for LOW in signal
(4) Refer to Figure 13-2 for Form 1 8080-Series MPU Parallel Interface Timing Characteristics

Alternatively, RD# and WR# can be keep stable while CS# serves as the data/command latch signal.

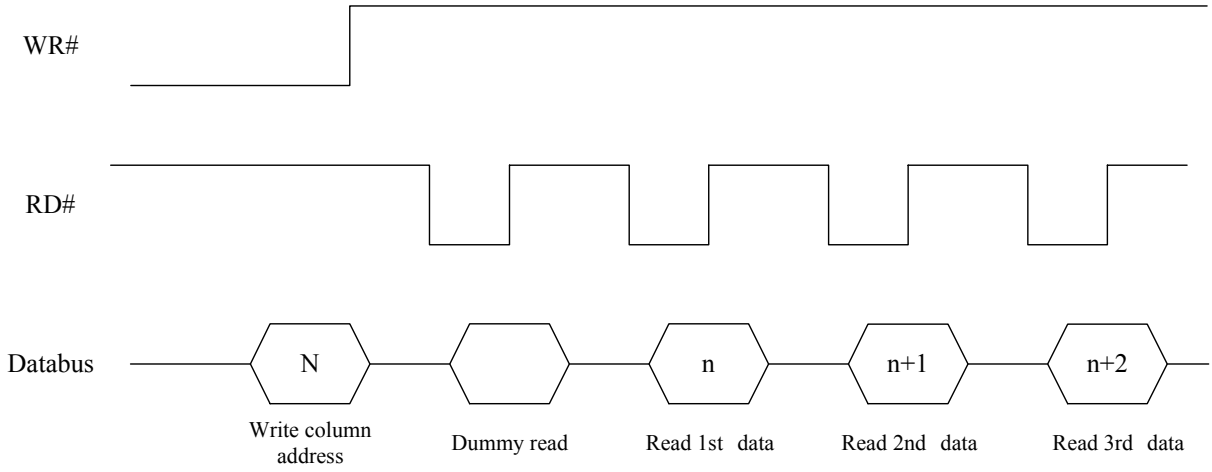
Table 8-4 : Control pins of 8080 interface (Form 2)

Function	RD#	WR#	CS#	D/C#
Write command	H	L	↑	L
Read status	L	H	↑	L
Write data	H	L	↑	H
Read data	L	H	↑	H

Note
(1) ↑ stands for rising edge of signal
(2) H stands for HIGH in signal
(3) L stands for LOW in signal
(4) Refer to Figure 13-3 for Form 2 8080-Series MPU Parallel Interface Timing Characteristics

In order to match the operating frequency of display RAM with that of the microprocessor, some pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read. This is shown in Figure 8-4.

Figure 8-4 : Display data read back procedure - insertion of dummy read



8.1.3 MCU Serial Interface

The serial interface consists of serial clock SCLK, serial data SDIN, D/C#, CS#. In SPI mode, D0 acts as SCLK, D1 acts as SDIN. For the unused data pins, D2 should be left open. The pins from D3 to D7, E and R/W# can be connected to an external ground.

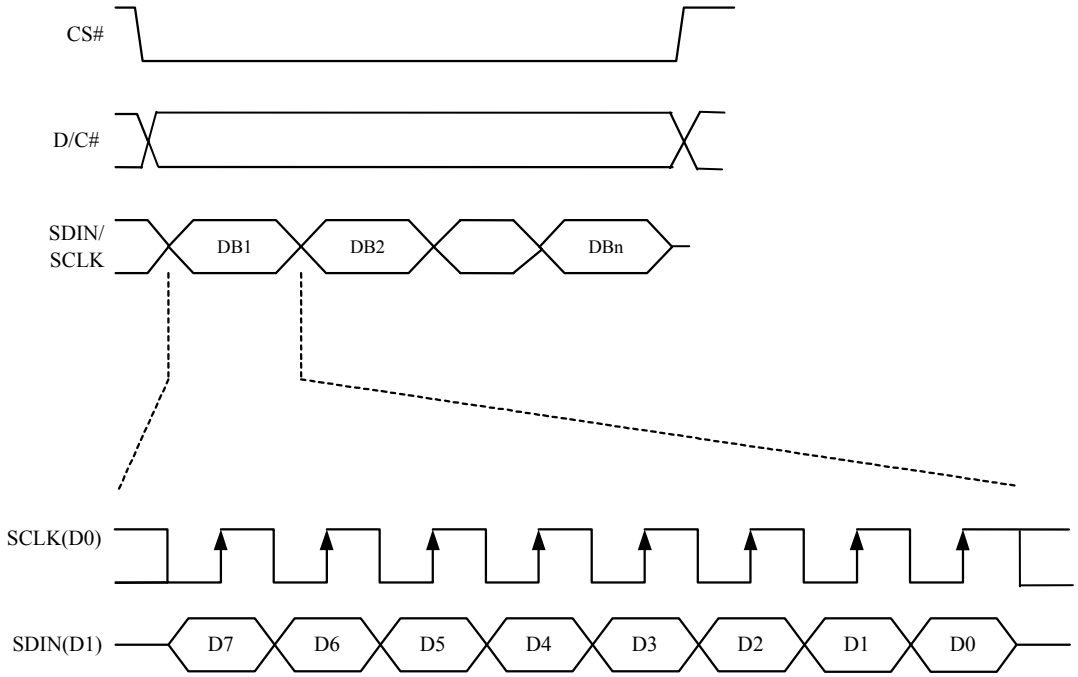
Table 8-5 : Control pins of Serial interface

Function	E(RD#)	R/W#(WR#)	CS#	D/C#	D0
Write command	Tie LOW	Tie LOW	L	L	↑
Write data	Tie LOW	Tie LOW	L	H	↑

Note
(1) ↑ stands for rising edge of signal
(2) H stands for HIGH in signal
(3) L stands for LOW in signal

SDIN is shifted into an 8-bit shift register on every rising edge of SCLK in the order of D7, D6, ... D0. D/C# is sampled on every eighth clock and the data byte in the shift register is written to the Graphic Display Data RAM (GDDRAM) or command register in the same clock.
Under serial mode, only write operations are allowed.

Figure 8-5 : Write procedure in SPI mode



8.1.4 MCU I^2C Interface

The I^2C communication interface consists of slave address bit SA0, I^2C-bus data signal SDA (SDA_{OUT}/D_2 for output and SDA_{IN}/D_1 for input) and I^2C-bus clock signal SCL (D_0). Both the data and clock signals must be connected to pull-up resistors. RES# is used for the initialization of device.

a) Slave address bit (SA0)
SSD1305 has to recognize the slave address before transmitting or receiving any information by the I^2C-bus. The device will respond to the slave address following by the slave address bit ("SA0" bit) and the read/write select bit ("R/W#" bit) with the following byte format,
b_7 b_6 b_5 b_4 b_3 b_2 b_1 b_0
0 1 1 1 1 0 SA0 R/W#
"SA0" bit provides an extension bit for the slave address. Either "0111100" or "0111101", can be selected as the slave address of SSD1305. D/C# pin acts as SA0 for slave address selection.
"R/W#" bit is used to determine the operation mode of the I^2C-bus interface. R/W#=1, it is in read mode. R/W#=0, it is in write mode.

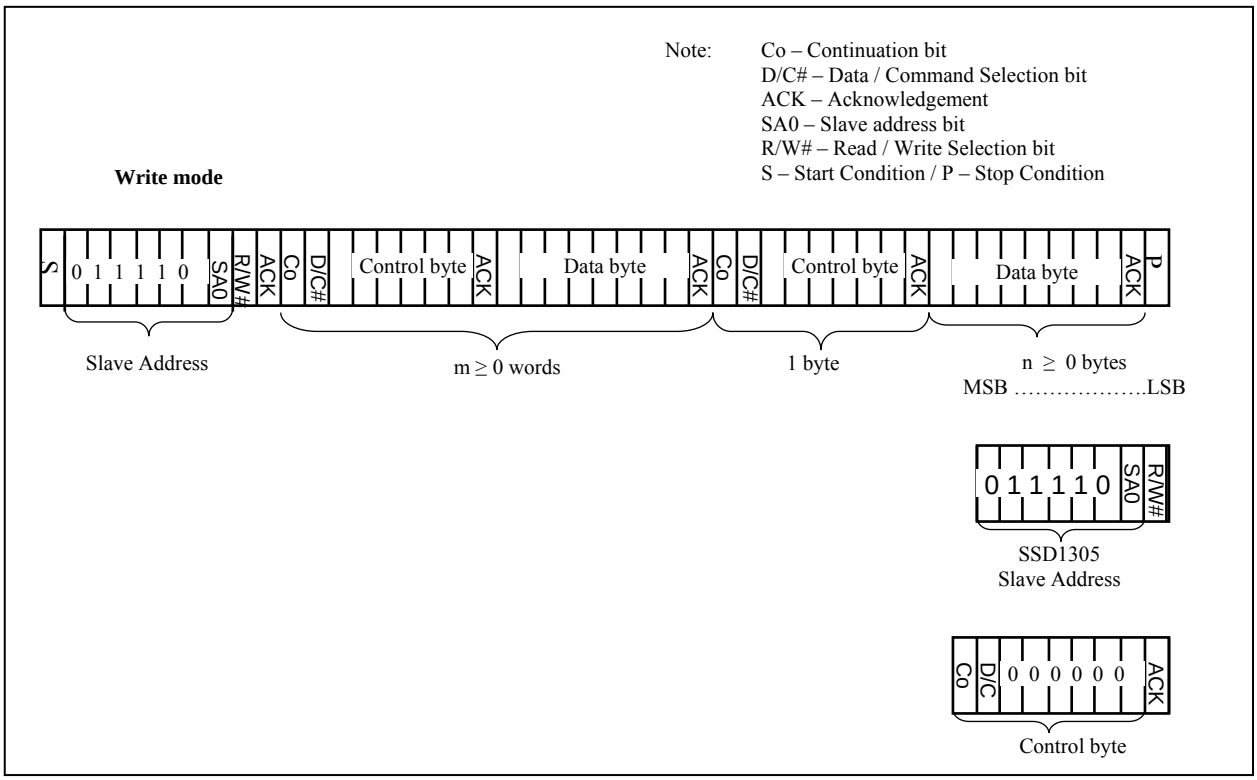
b) I^2C-bus data signal (SDA)
SDA acts as a communication channel between the transmitter and the receiver. The data and the acknowledgement are sent through the SDA.
It should be noticed that the ITO track resistance and the pulled-up resistance at "SDA" pin becomes a voltage potential divider. As a result, the acknowledgement would not be possible to attain a valid logic 0 level in "SDA".
"SDA_{IN}" and "SDA_{OUT}" are tied together and serve as SDA. The "SDA_{IN}" pin must be connected to act as SDA. The "SDA_{OUT}" pin may be disconnected. When "SDA_{OUT}" pin is disconnected, the acknowledgement signal will be ignored in the I^2C-bus.

c) I^2C-bus clock signal (SCL)
The transmission of information in the I^2C-bus is following a clock signal, SCL. Each transmission of data bit is taken place during a single clock period of SCL.

8.1.4.1 I^2C-bus Write data

The I^2C-bus interface gives access to write data and command into the device. Please refer to Figure 8-6 for the write mode of I^2C-bus in chronological order.

Figure 8-6 : I^2C -bus data format



8.1.4.2 Write mode for I^2C

1) The master device initiates the data communication by a start condition. The definition of the start condition is shown in Figure 8-7. The start condition is established by pulling the SDA from HIGH to LOW while the SCL stays HIGH.
2) The slave address is following the start condition for recognition use. For the SSD1305, the slave address is either “b0111100” or “b0111101” by changing the SA0 to LOW or HIGH (D/C pin acts as SA0).
3) The write mode is established by setting the R/W# bit to logic “0”.
4) An acknowledgement signal will be generated after receiving one byte of data, including the slave address and the R/W# bit. Please refer to the Figure 8-8 for the graphical representation of the acknowledge signal. The acknowledge bit is defined as the SDA line is pulled down during the HIGH period of the acknowledgement related clock pulse.
5) After the transmission of the slave address, either the control byte or the data byte may be sent across the SDA. A control byte mainly consists of Co and D/C# bits following by six “0” ‘s.
    a. If the Co bit is set as logic “0”, the transmission of the following information will contain data bytes only.
    b. The D/C# bit determines the next data byte is acted as a command or a data. If the D/C# bit is set to logic “0”, it defines the following data byte as a command. If the D/C# bit is set to logic “1”, it defines the following data byte as a data which will be stored at the GDDRAM. The GDDRAM column address pointer will be increased by one automatically after each data write.
6) Acknowledge bit will be generated after receiving each control byte or data byte.
7) The write mode will be finished when a stop condition is applied. The stop condition is also defined in Figure 8-7. The stop condition is established by pulling the “SDA in” from LOW to HIGH while the “SCL” stays HIGH.

Figure 8-7 : Definition of the Start and Stop Condition

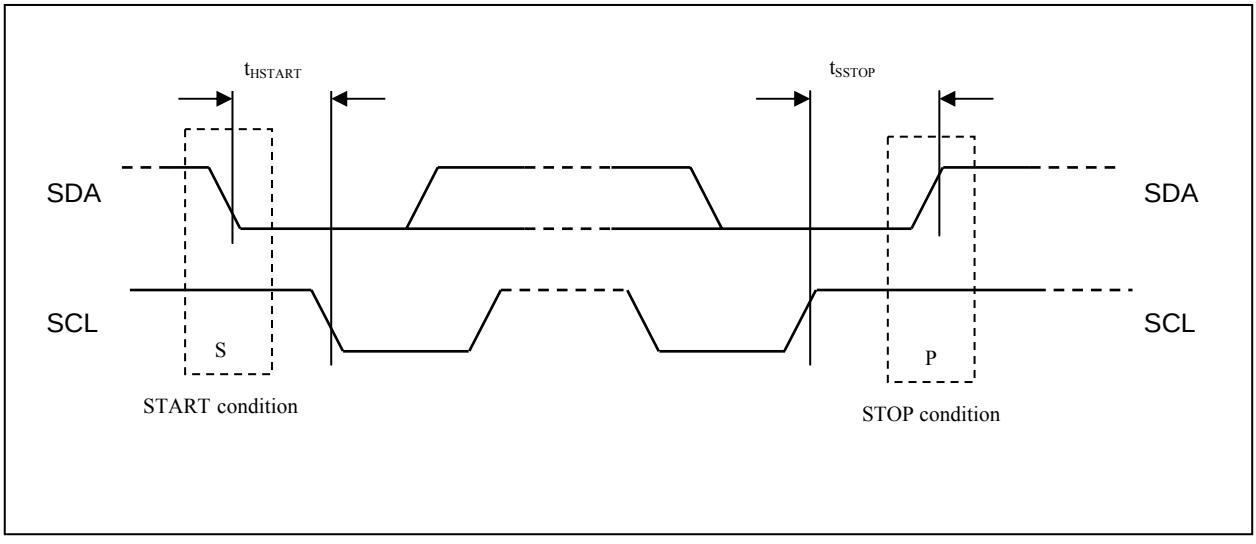


Figure 8-8 : Definition of the acknowledgement condition

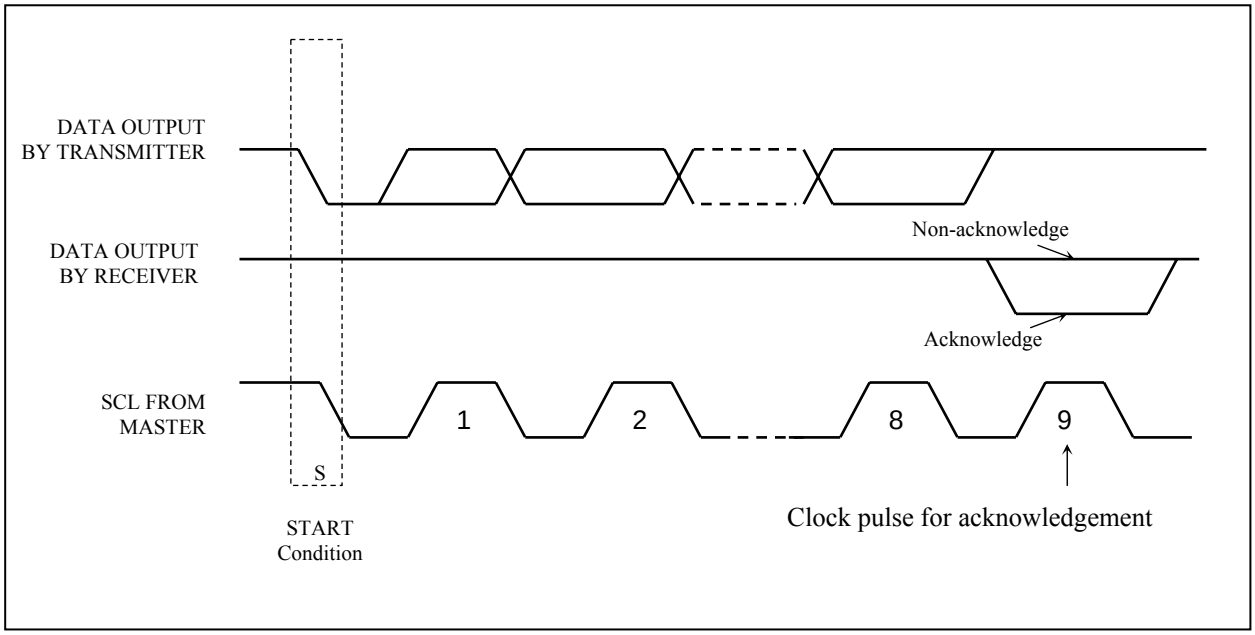
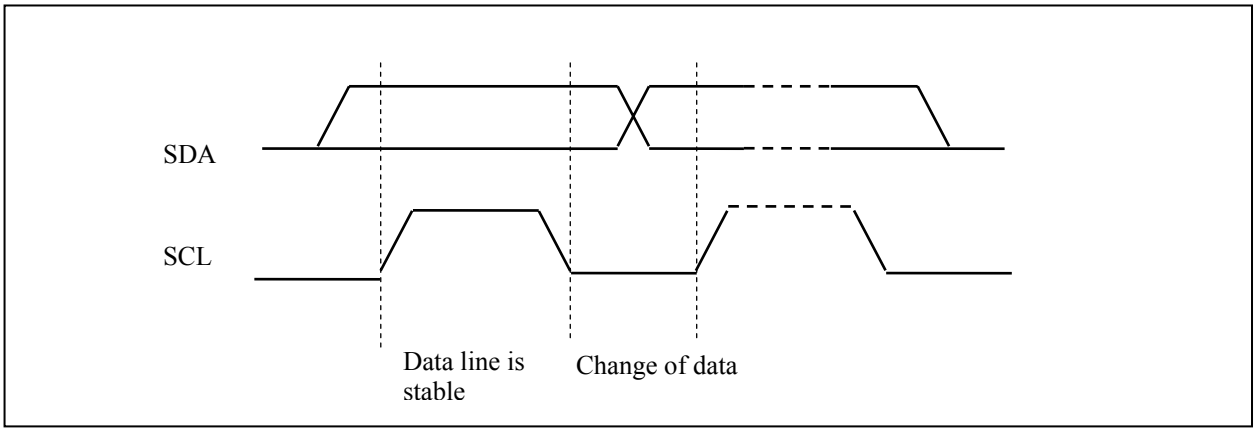


Please be noted that the transmission of the data bit has some limitations.

1. The data bit, which is transmitted during each SCL pulse, must keep at a stable state within the "HIGH" period of the clock pulse. Please refer to the Figure 8-9 for graphical representations. Except in start or stop conditions, the data line can be switched only when the SCL is LOW.
2. Both the data line (SDA) and the clock line (SCL) should be pulled up by external resistors.

Figure 8-9 : Definition of the data transfer condition



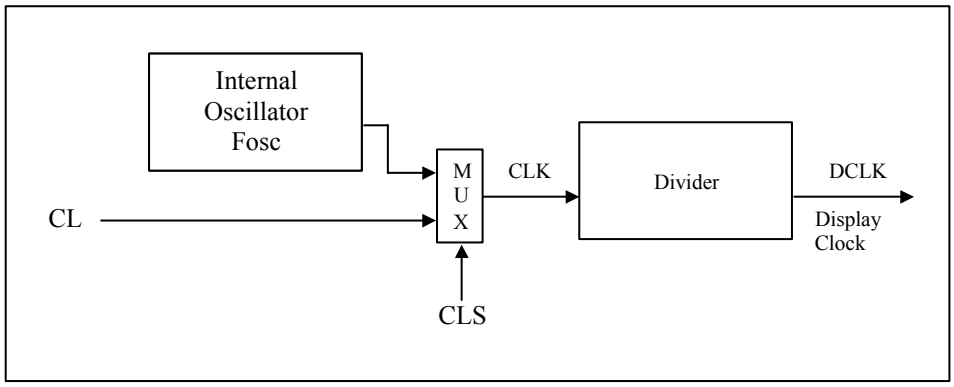
8.2 Command Decoder

This module determines whether the input data is interpreted as data or command. Data is interpreted based upon the input of the D/C# pin.

If D/C# pin is HIGH, D[7:0] is interpreted as display data written to Graphic Display Data RAM (GDDRAM). If it is LOW, the input at D[7:0] is interpreted as a command. Then data input will be decoded and written to the corresponding command register.

8.3 Oscillator Circuit and Display Time Generator

Figure 8-10 : Oscillator Circuit and Display Time Generator



This module is an on-chip LOW power RC oscillator circuitry. The operation clock (CLK) can be generated either from internal oscillator or external source CL pin. This selection is done by CLS pin. If CLS pin is pulled HIGH, internal oscillator is chosen and CL should be connected to V_{SS}. Pulling CLS pin LOW disables internal oscillator and external clock must be connected to CL pins for proper operation. When the internal oscillator is selected, its output frequency Fosc can be changed by command D5h A[7:4].

The display clock (DCLK) for the Display Timing Generator is derived from CLK. The division factor "D" can be programmed from 1 to 16 by command D5h

$$DCLK = F_{OSC} / D$$

The frame frequency of display is determined by the following formula.

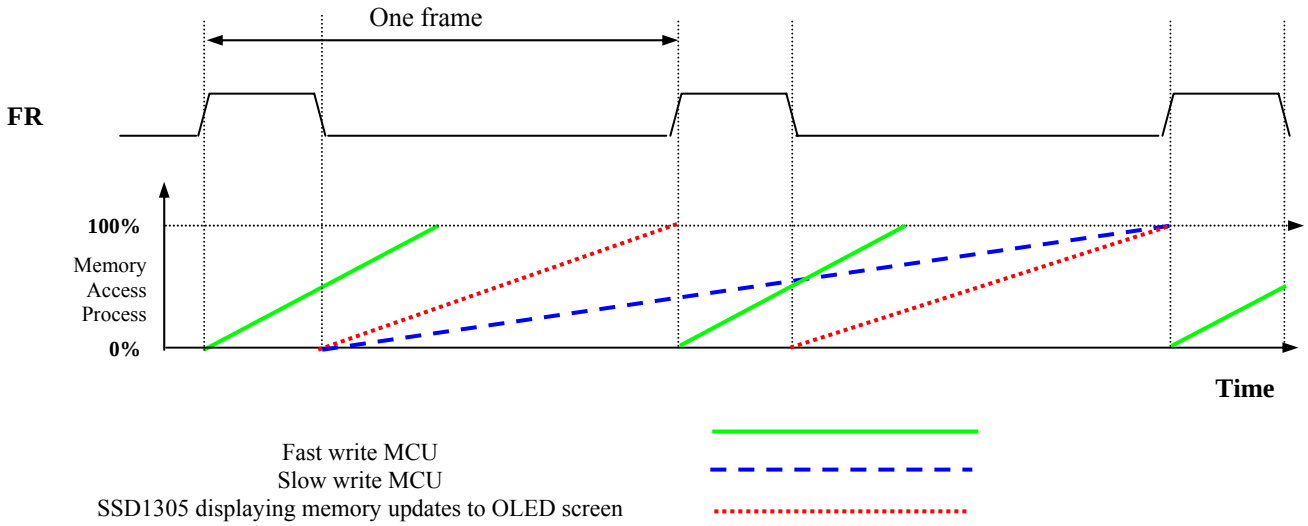
$$F_{FRM} = \frac{F_{osc}}{D \times K \times No.\ of\ Mux}$$

where

- D stands for clock divide ratio. It is set by command D5h A[3:0]. The divide ratio has the range from 1 to 16.
- K is the number of display clocks per row. The value is derived by
  K = Phase 1 period + Phase 2 period + BANK0 pulse width
  = 2 + 2 + 50 = 54 at power on reset
  (Please refer to Section 8.6 "Segment Drivers / Common Drivers" for the details of the "Phase")
- Number of multiplex ratio is set by command A8h. The power on reset value is 63 (i.e. 64MUX).
- F_{OSC} is the oscillator frequency. It can be changed by command D5h A[7:4]. The higher the register setting results in higher frequency.

8.4 FR synchronization

FR synchronization signal can be used to prevent tearing effect.



The starting time to write a new image to OLED driver is depended on the MCU writing speed. If MCU can finish writing a frame image within one frame period, it is classified as fast write MCU. For MCU needs longer writing time to complete (more than one frame but within two frames), it is a slow write one.

For fast write MCU: MCU should start to write new frame of ram data just after rising edge of FR pulse and should be finished well before the rising edge of the next FR pulse.

For slow write MCU: MCU should start to write new frame ram data after the falling edge of the 1st FR pulse and must be finished before the rising edge of the 3rd FR pulse.

8.5 Reset Circuit

When RES# input is LOW, the chip is initialized with the following status:

1. Display is OFF
2. 132 x 64 Display Mode
3. Normal segment and display data column address and row address mapping (SEG0 mapped to address 00h and COM0 mapped to address 00h)
4. Shift register data clear in serial interface
5. Display start line is set at display RAM address 0
6. Column address counter is set at 0
7. Normal scan direction of the COM outputs
8. Contrast control register is set at 80h
9. Normal display mode (Equivalent to A4h command)

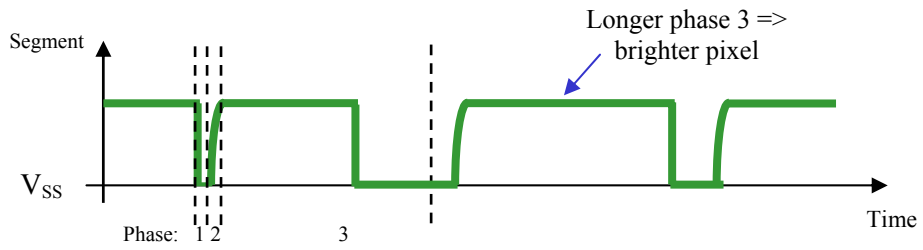
8.6 Segment Drivers / Common Drivers

Segment drivers deliver 132 current sources to drive the OLED panel. The driving current can be adjusted from 0 to 320uA with 256 steps. Common drivers generate voltage-scanning pulses.

The segment driving waveform is divided into three phases:

1. In phase 1, the OLED pixel charges of previous image are discharged in order to prepare for next image content display.
2. In phase 2, the OLED pixel is driven to the targeted voltage. The pixel is driven to attain the corresponding voltage level from V_{SS}. The period of phase 2 can be programmed in length from 1 to 15 DCLKs. If the capacitance value of the pixel of OLED panel is larger, a longer period is required to charge up the capacitor to reach the desired voltage.
3. In phase 3, the OLED driver switches to use current source to drive the OLED pixels and this is the current drive stage. SSD1305 employs PWM (Pulse Width Modulation) method to control the brightness of area color A, B, C, D color individually. The longer the waveform in current drive stage is, the brighter is the pixel and vice versa.

Figure 8-11 : Segment Output Waveform in three phases

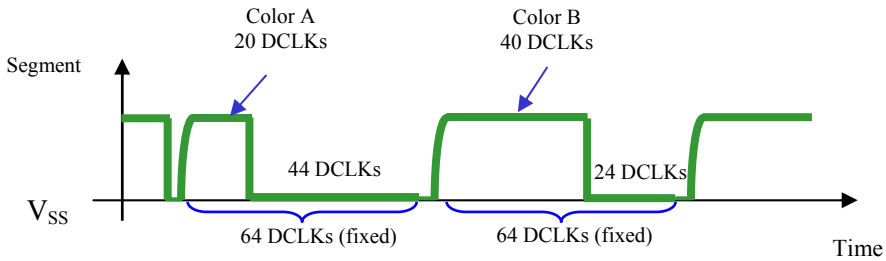


After finishing phase 3, the driver IC will go back to phase 1 to display the next row image data. This three-step cycle is run continuously to refresh image display on OLED panel.

The length of phase 3 for area colors: A,B,C and monochrome BANK0 can be configured by command 91h "Set Look Up Table". There are 64 steps available for each color but the one of color D is fixed at 64. The unit of the step is in DCLK.

For example, the look up table for area color A, B, is set to 20, 40 DCLKs respectively. Color B is set to be brighter than color A. Then the result segment output waveform of these two colors is shown below.

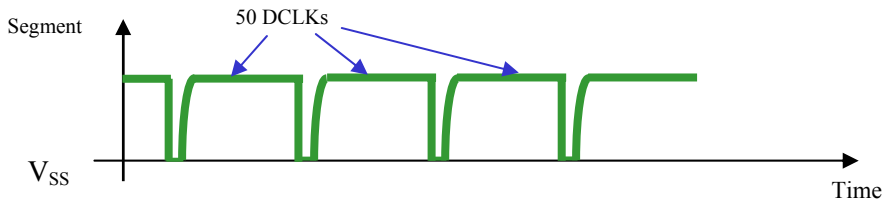
Figure 8-12 : Segment Output Waveform for two different colors LUT setting



In phase 3, the segment output waveforms under the monochrome mode and area color mode are different.

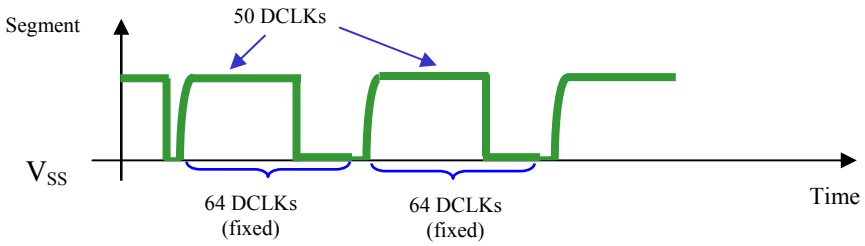
In monochrome mode, if the length of current drive pulse width is set to 50, after finishing 50 DCLKs in current drive phase, the driver IC will go back to phase 1 for next row display.

Figure 8-13 : Example of Segment Output Waveform of monochrome display section under monochrome mode



In area color mode, the phase 3 of both BANK0 and area color banks (BANK1 to BANK32) are fixed into 64 DCLKs. For instance, if the length of the pulse width is set to 50, then after the end of 50 DCLKs of current drive phase, the segment waveform will be gone to V_{SS} level and the driver is still in current drive phase. This phase will be end after 64 DCLKs from the start of the phase is passed. And then the drive goes back to phase 1 for next row display. Figure 8-14 shows the example of the segment output waveform of area color display section when the pulse width of area color is set to 50.

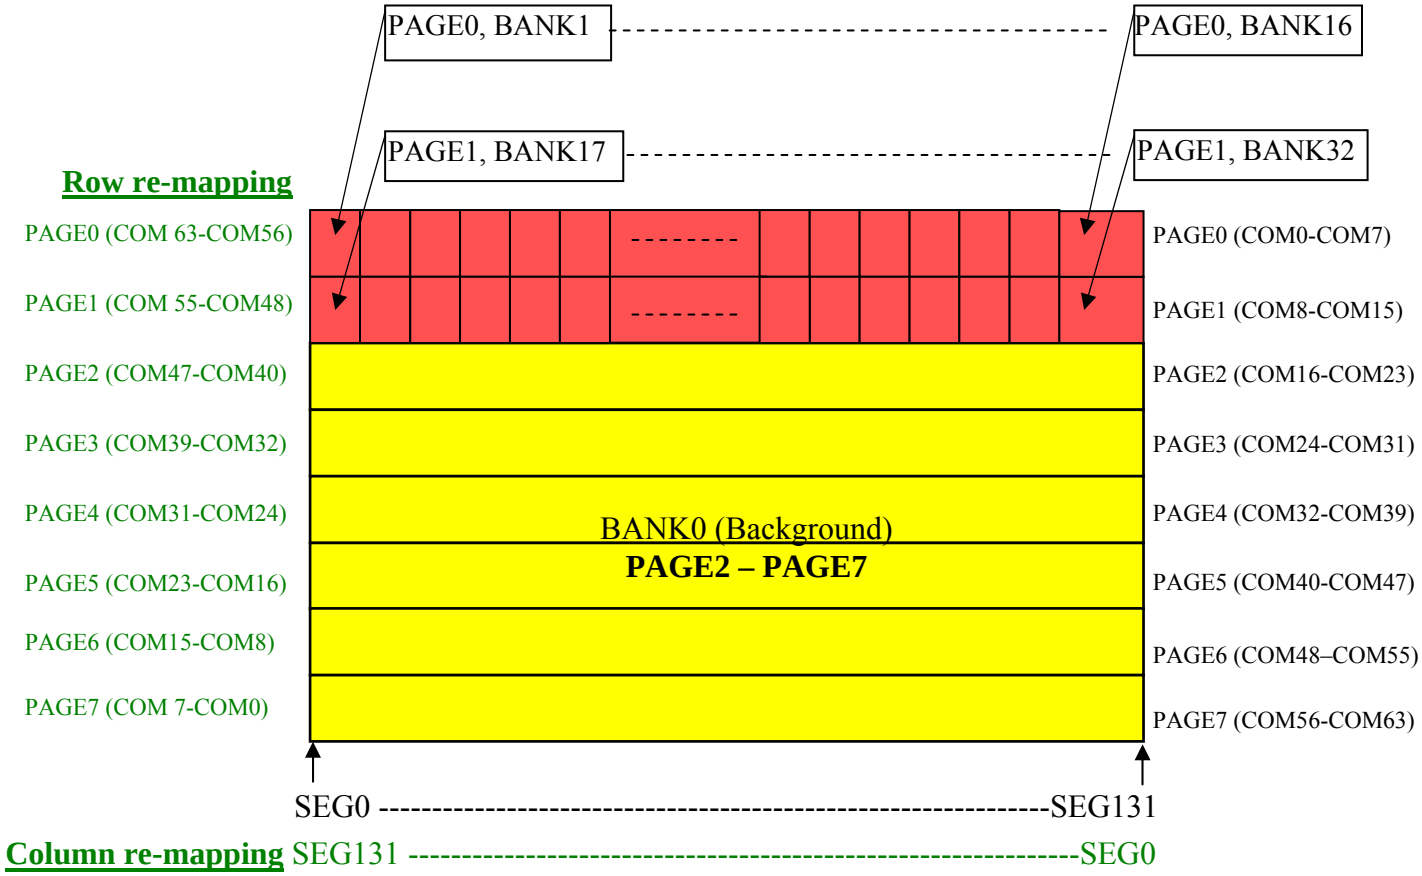
Figure 8-14 : Example of Segment Output Waveform of area color display section under area color mode



8.7 Graphic Display Data RAM (GDDRAM)

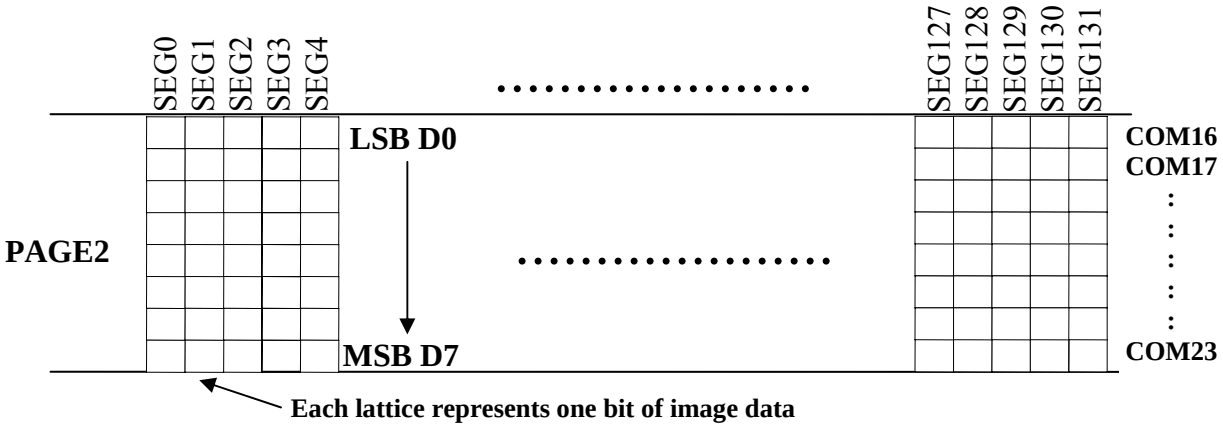
The GDDRAM is a bit mapped static RAM holding the bit pattern to be displayed. The size of the RAM is 132 x 64 bits and the RAM is divided into eight pages, from PAGE0 to PAGE7, as shown in Figure 8-15. In GDDRAM, PAGE0 and PAGE1 are belonged to area color section with resolution 132x16. PAGE2 to PAGE7 are used for monochrome 132x48 dot matrix display.

Figure 8-15 : GDDRAM pages structure of SSD1305



When one data byte is written into GDDRAM, all the rows image data of the same page of the current column are filled (i.e. the whole column (8 bits) pointed by the column address pointer is filled.). Data bit D0 is written into the top row, while data bit D7 is written into bottom row as shown in Figure 8-16.

Figure 8-16 : Enlargement of GDDRAM (No row re-mapping and column-remapping)

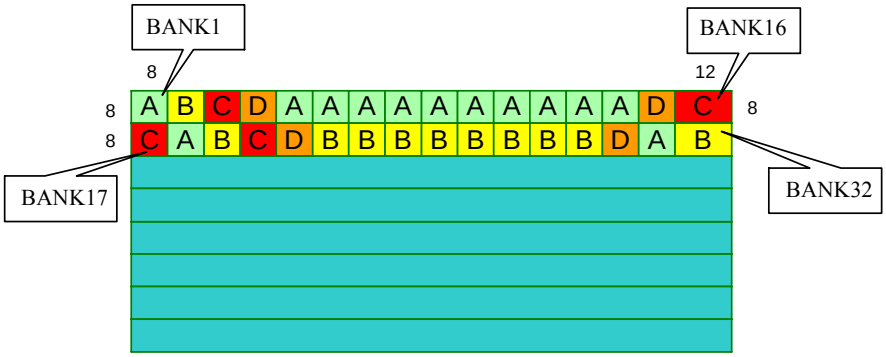


For mechanical flexibility, re-mapping on both Segment and Common outputs can be selected by software as shown in Figure 8-15.
For vertical shifting of the display, an internal register storing the display start line can be set to control the portion of the RAM data to be mapped to the display (command D3h).

8.8 Area Color Decoder

The 132x64 display matrix is divided into 8 pages. The first two pages, PAGE0 and PAGE1, are divided into 32 banks. BANK16 and BANK32 consist of a display area of 12x8 pixels. Other banks (BANK0 to BANK15 & BANK17 to BANK31) have matrices of 8x8 pixels. Each bank can be programmed to any one of the four colors (color A, B, C and D) as the example shown in Figure 8-17. Detailed operation can be referred to command 92h in Table 9-1.

Figure 8-17 : Example of area color assignment on a 132x64 OLED panel



8.9 SEG/COM Driving block

This block is used to derive the incoming power sources into the different levels of internal use voltage and current.

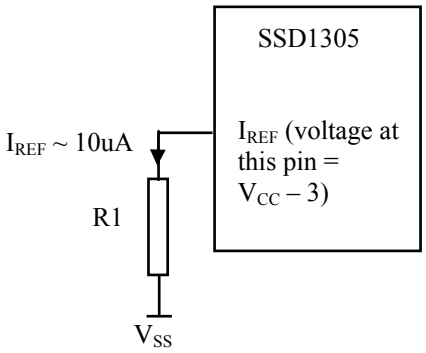
- V_{CC} is the most positive voltage supply.
- V_{COMH} is the Common deselected level. It is internally regulated.
- V_{LSS} is the ground path of the analog and panel current.
- I_{REF} is a reference current source for segment current drivers I_{SEG}. The relationship between reference current and segment current of a color is:

  I_{SEG} = Contrast / 256 x I_{REF} x scale factor

  in which
  the contrast (0~255) is set by Set Contrast command 81h; and
  the scale factor is 32 by default.

  The magnitude of I_{REF} is controlled by the value of resistor, which is connected between I_{REF} pin and Vss as shown in Figure 8-18. It is recommended to set I_{REF} to 10uA+/- 2uA so as to achieve I_{SEG} = 320uA at maximum contrast 255.

Figure 8-18 : I_{REF} Current Setting by Resistor Value



Since the voltage at I_{REF} pin is V_{CC} – 3V, the value of resistor R1 can be found as below.

R1 = (Voltage at I_{REF} – V_{SS}) / I_{REF} = (V_{CC} – 3) / 10uA ≈ 910kΩ for V_{CC} = 12V.

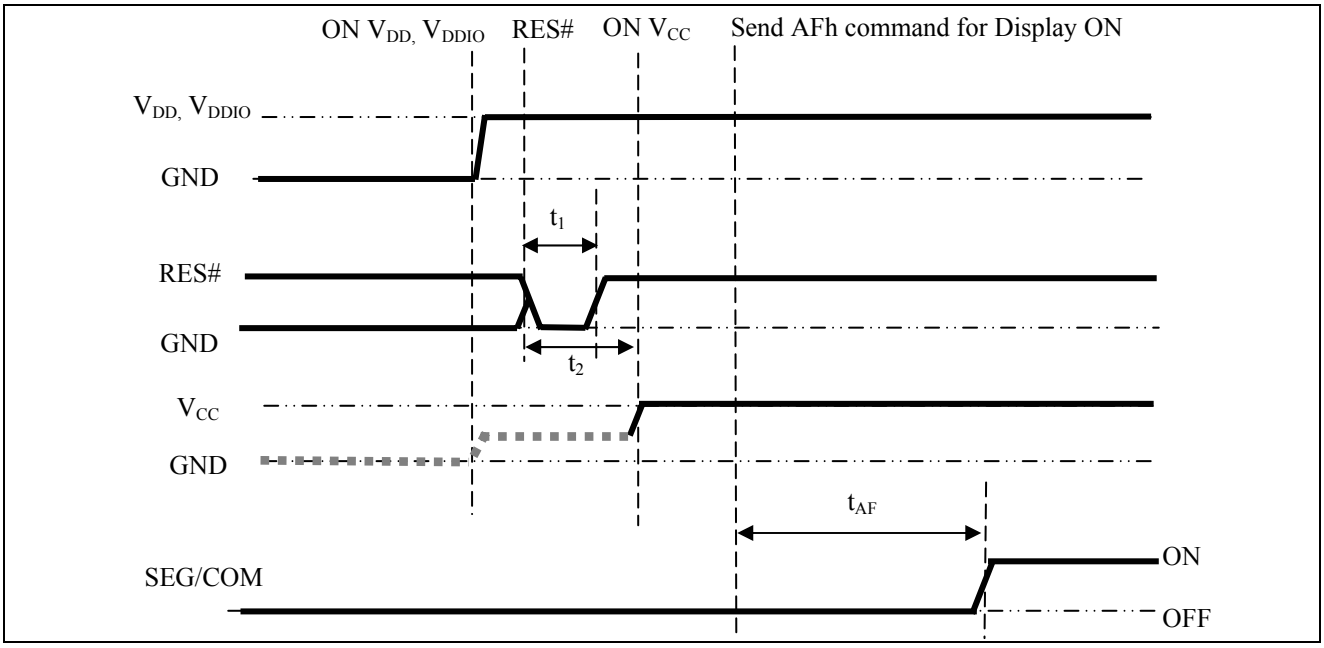
8.10 Power ON and OFF sequence

The following figures illustrate the recommended power ON and power OFF sequence of SSD1305 (assume V_{DD} and V_{DDIO} are at the same voltage level).

Power ON sequence:

1. Power ON $V_{DD,}$ $V_{DDIO.}$
2. After V_{DD}, V_{DDIO} become stable, set RES# pin LOW (logic low) for at least 3us (t_1) [4] and then HIGH (logic high).
3. After set RES# pin LOW (logic low), wait for at least 3us (t_2). Then Power ON $V_{CC.}$ [1]
4. After V_{CC} become stable, send command AFh for display ON. SEG/COM will be ON after 100ms (t_{AF}).

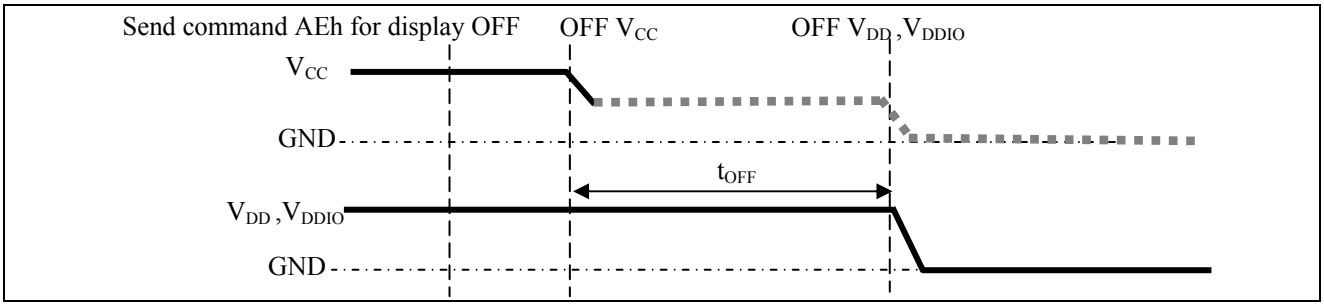
Figure 8-19 : The Power ON sequence



Power OFF sequence:

1. Send command AEh for display OFF.
2. Power OFF $V_{CC.}$ [1], [2], [3]
3. Wait for t_{OFF}. Power OFF $V_{DD,}$ $V_{DDIO.}$.(where Minimum t_{OFF}=0ms [5] , Typical t_{OFF}=100ms)

Figure 8-20 : The Power OFF sequence



Note:

[1] Since an ESD protection circuit is connected between V_{DD}, V_{DDIO} and V_{CC}, V_{CC} becomes lower than V_{DD} whenever V_{DD}, V_{DDIO} is ON and V_{CC} is OFF as shown in the dotted line of V_{CC} in Figure 8-19 and Figure 8-20.

[2] V_{CC} should be kept float (disable) when it is OFF.

[3] Power Pins (V_{DD} , V_{CC}) can never be pulled to ground under any circumstance.

[4] The register values are reset after t_1.

[5] V_{DD} should not be Power OFF before V_{CC} Power OFF.

9 COMMAND TABLE

Table 9-1: Command Table

(D/C#=0, R/W#(WR#) = 0, E(RD#=1) unless specific setting is stated)

Fundamental Command Table											
D/C#	**Hex**	**D7**	**D6**	**D5**	**D4**	**D3**	**D2**	**D1**	**D0**	**Command**	**Description**
0	00~0F	0	0	0	0	X_3	X_2	X_1	X_0	Set Lower Column Start Address for Page Addressing Mode	Set the lower nibble of the column start address register for Page Addressing Mode using X[3:0] as data bits. The initial display line register is reset to 0000b after RESET.
0	10~1F	0	0	0	1	X_3	X_2	X_1	X_0	Set Higher Column Start Address for Page Addressing Mode	Set the higher nibble of the column start address register for Page Addressing Mode using X[3:0] as data bits. The initial display line register is reset to 0000b after RESET.
0 0	20 A[1:0]	0 *	0 *	1 *	0 *	0 *	0 *	0 A_1	0 A_0	Set Memory Addressing Mode	A[1:0] = 00b, Horizontal Addressing Mode A[1:0] = 01b, Vertical Addressing Mode A[1:0] = 10b, Page Addressing Mode (RESET) A[1:0] = 11b, Invalid
0 0 0	21 A[7:0] B[7:0]	0 A_7 B_7	0 A_6 B_6	1 A_5 B_5	0 A_4 B_4	0 A_3 B_3	0 A_2 B_2	0 A_1 B_1	1 A_0 B_0	Set Column Address	Setup column start and end address A[7:0] : Column start address, range : 0-131d, (RESET=0d) B[7:0]: Column end address, range : 0-131d, (RESET =131d)
0 0 0	22 A[2:0] B[2:0]	0 * *	0 * *	1 * *	0 * *	0 * *	0 A_2 B_2	1 A_1 B_1	0 A_0 B_0	Set Page Address	Setup page start and end address A[2:0] : Page start Address, range : 0-7d, (RESET = 0d) B[2:0] : Page end Address, range : 0-7d, (RESET = 7d)
0	40~7F	0	1	X_5	X_4	X_3	X_2	X_1	X_0	Set Display Start Line	Set display RAM display start line register from 0-63 using $X_5X_3X_2X_1X_0$. Display start line register is reset to 000000b during RESET.
0 0	81 A[7:0]	1 A_7	0 A_6	0 A_5	0 A_4	0 A_3	0 A_2	0 A_1	1 A_0	Set Contrast Control For BANK0	Double byte command to select 1 out of 256 contrast steps. Contrast increases as the value increases. (RESET = 80h)
0 0	82 A[7:0]	1 A_7	0 A_6	0 A_5	0 A_4	0 A_3	0 A_2	1 A_1	0 A_0	Set Brightness For Area Color Banks	Double byte command to select 1 out of 256 brightness steps. Brightness increases as the value increases. (RESET = 80h)
0 0 0 0 0	91 X[5:0] A[5:0] B[5:0] C[5:0]	1 * * * *	0 * * * *	0 X_5 A_5 B_5 C_5	1 X_4 A_4 B_4 C_4	0 X_3 A_3 B_3 C_3	0 X_2 A_2 B_2 C_2	0 X_1 A_1 B_1 C_1	1 X_0 A_0 B_0 C_0	Set Look Up Table (LUT)	Set current drive pulse width of BANK0, Color A, B and C. BANK0: X[5:0] = 31… 63; for pulse width set to 32 ~ 64 clocks (RESET = 110001b) Color A: A[5:0] same as above (RESET = 111111b) Color B: B[5:0] same as above (RESET = 111111b) Color C: C[5:0] same as above (RESET = 111111b) **Note** (1) Color D pulse width is fixed at 64 clocks pulse.

Fundamental Command Table

Graphic Acceleration Command Table											
D/C#	**Hex**	**D7**	**D6**	**D5**	**D4**	**D3**	**D2**	**D1**	**D0**	**Command**	**Description**
0	2E	0	0	1	0	1	1	1	0	Deactivate scroll	Stop scrolling that is configured by command 26h/27h/29h/2Ah. **Note** (1) After sending 2Eh command to deactivate the scrolling action, the ram data needs to be rewritten.
0	2F	0	0	1	0	1	1	1	1	Activate scroll	Start scrolling that is configured by the scrolling setup commands :26h/27h/29h/2Ah with the following valid sequences: Valid command sequence 1: 26h ;2Fh. Valid command sequence 2: 27h ;2Fh. Valid command sequence 3: 29h ;2Fh. Valid command sequence 4: 2Ah ;2Fh. For example, if "26h; 2Ah; 2Fh." commands are issued, the setting in the last scrolling setup command, i.e. 2Ah in this case, will be executed. In other words, setting in the last scrolling setup command overwrites the setting in the previous scrolling setup commands.
0 0 0	A3 A[5:0] B[6:0]	1 * *	0 * B_6	1 A_5 B_5	0 A_4 B_4	0 A_3 B_3	0 A_2 B_2	1 A_1 B_1	1 A_0 B_0	Set Vertical Scroll Area	A[5:0] : Set No. of rows in top fixed area. The No. of rows in top fixed area is referenced to the top of the GDDRAM (i.e. row 0).[RESET = 0] B[6:0] : Set No. of rows in scroll area. This is the number of rows to be used for vertical scrolling. The scroll area starts in the first row below the top fixed area. [RESET = 64] **Note** (1) A[5:0]+B[6:0] <= MUX ratio (2) B[6:0] <= MUX ratio (3a) Vertical scrolling offset (E[5:0] in 29h/2Ah) < B[6:0] (3b) Set Display Start Line (X5X4X3X2X1X0 of 40h~7Fh) < B[6:0] (4) The last row of the scroll area shifts to the first row of the scroll area. (5) For 64d MUX display A[5:0] = 0, B[6:0]=64 : whole area scrolls A[5:0]= 0, B[6:0] < 64 : top area scrolls A[5:0] + B[6:0] < 64 : central area scrolls A[5:0] + B[6:0] = 64 : bottom area scrolls Please refer to Figure 10-14 for details.

Note
(1) "*" stands for "Don't care".

Table 9-2 : Read Command Table

Bit Pattern	Command	Description
$D_7D_6D_5D_4D_3D_2D_1D_0$	Status Register Read	D[7] : Reserve D[6] : "1" for display OFF / "0" for display ON D[5] : Reserve D[4] : Reserve D[3] : Reserve D[2] : Reserve D[1] : Reserve D[0] : Reserve

Note
(1) Patterns other than those given in the Command Table are prohibited to enter the chip as a command; as unexpected results can occur.

9.1 Data Read / Write

To read data from the GDDRAM, select HIGH for both the R/W# (WR#) pin and the D/C# pin for 6800-series parallel mode and select LOW for the E (RD#) pin and HIGH for the D/C# pin for 8080-series parallel mode. No data read is provided in serial mode operation.
In normal data read mode the GDDRAM column address pointer will be increased automatically by one after each data read.
Also, a dummy read is required before the first data read.
To write data to the GDDRAM, select LOW for the R/W# (WR#) pin and HIGH for the D/C# pin for both 6800-series parallel mode and 8080-series parallel mode. The serial interface mode is always in write mode. The GDDRAM column address pointer will be increased automatically by one after each data write.

Table 9-3 : Address increment table (Automatic)

D/C#	R/W# (WR#)	Comment	Address Increment
0	0	Write Command	No
0	1	Read Status	No
1	0	Write Data	Yes
1	1	Read Data	Yes (1)

Note
(1) If read-data command is issued in read-modify-write mode no address increase occurs.

10 COMMAND DESCRIPTIONS

10.1 Fundamental Command

10.1.1 Set Lower Column Start Address for Page Addressing Mode (00h~0Fh)

This command specifies the lower nibble of the 8-bit column start address for the display data RAM under Page Addressing Mode. The column address will be incremented by each data access. Please refer to Section Table 9-1 and Section 10.1.3 for details.

10.1.2 Set Higher Column Start Address for Page Addressing Mode (10h~1Fh)

This command specifies the higher nibble of the 8-bit column start address for the display data RAM under Page Addressing Mode. The column address will be incremented by each data access. Please refer to Section Table 9-1 and Section 10.1.3 for details.

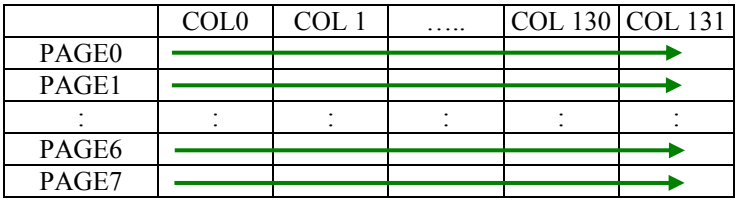
10.1.3 Set Memory Addressing Mode (20h)

There are 3 different memory addressing mode in SSD1305: page addressing mode, horizontal addressing mode and vertical addressing mode. This command sets the way of memory addressing into one of the above three modes. In there, "COL" means the graphic display data RAM column.

Page addressing mode (A[1:0]=10xb)

In page addressing mode, after the display RAM is read/written, the column address pointer is increased automatically by 1. If the column address pointer reaches column end address, the column address pointer is reset to column start address and page address pointer is not changed. Users have to set the new page and column addresses in order to access the next page RAM content The sequence of movement of the PAGE and column address point for page addressing mode is shown in Figure 10-1.

Figure 10-1 : Address Pointer Movement of Page addressing mode

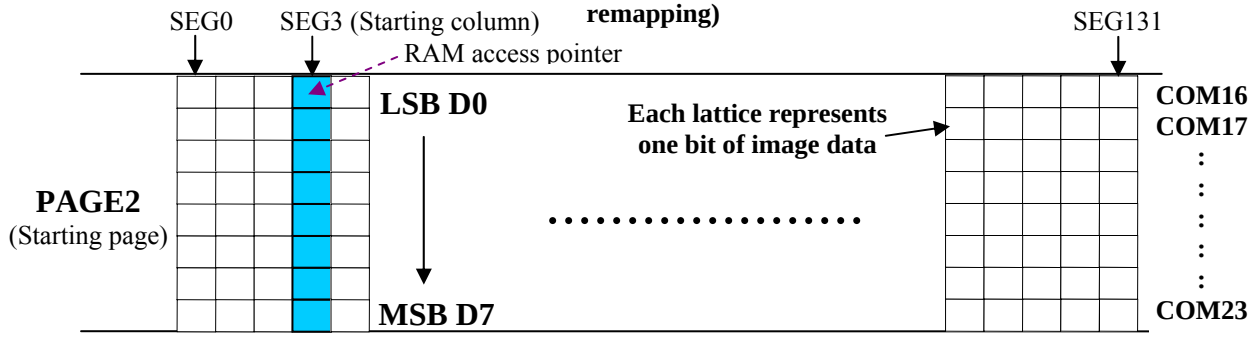


In normal display data RAM read or write and page addressing mode, the following steps are required to define the starting RAM access pointer location:

- Set the page start address of the target display location by command B0h to B7h.
- Set the lower start column address of pointer by command 00h~0Fh.
- Set the upper start column address of pointer by command 10h~1Fh.

For example, if the page address is set to B2h, lower column address is 03h and upper column address is 10h, then that means the starting column is SEG3 of PAGE2. The RAM access pointer is located as shown in Figure 10-2. The input data byte will be written into RAM position of column 3.

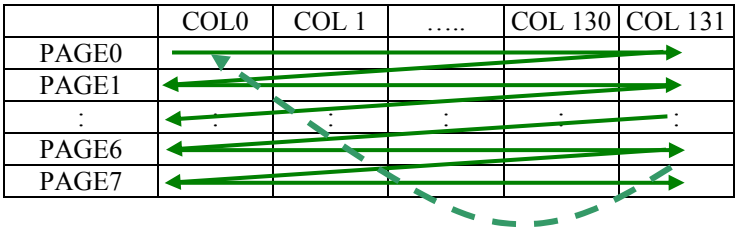
Figure 10-2 : Example of GDDRAM access pointer setting in Page Addressing Mode (No row and column-remapping)



Horizontal addressing mode (A[1:0]=00b)

In horizontal addressing mode, after the display RAM is read/written, the column address pointer is increased automatically by 1. If the column address pointer reaches column end address, the column address pointer is reset to column start address and page address pointer is increased by 1. The sequence of movement of the page and column address point for horizontal addressing mode is shown in Figure 10-3. When both column and page address pointers reach the end address, the pointers are reset to column start address and page start address (Dotted line in Figure 10-3.)

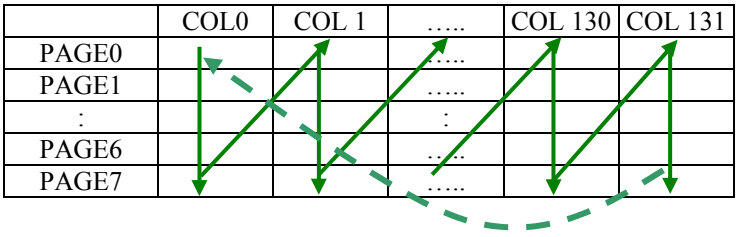
Figure 10-3 : Address Pointer Movement of Horizontal addressing mode



Vertical addressing mode: (A[1:0]=01b)

In vertical addressing mode, after the display RAM is read/written, the page address pointer is increased automatically by 1. If the page address pointer reaches the page end address, the page address pointer is reset to page start address and column address pointer is increased by 1. The sequence of movement of the page and column address point for vertical addressing mode is shown in Figure 10-4. When both column and page address pointers reach the end address, the pointers are reset to column start address and page start address (Dotted line in Figure 10-4.)

Figure 10-4 : Address Pointer Movement of Vertical addressing mode



In normal display data RAM read or write and horizontal / vertical addressing mode, the following steps are required to define the RAM access pointer location:

- Set the column start and end address of the target display location by command 21h.
- Set the page start and end address of the target display location by command 22h.

Example is shown in Figure 10-5.

10.1.4 Set Column Address (21h)

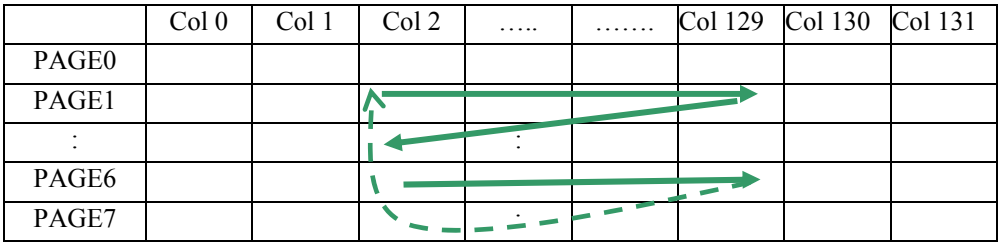
This triple byte command specifies column start address and end address of the display data RAM. This command also sets the column address pointer to column start address. This pointer is used to define the current read/write column address in graphic display data RAM. If horizontal address increment mode is enabled by command 20h, after finishing read/write one column data, it is incremented automatically to the next column address. Whenever the column address pointer finishes accessing the end column address, it is reset back to start column address and the row address is incremented to the next row.

10.1.5 Set Page Address (22h)

This triple byte command specifies page start address and end address of the display data RAM. This command also sets the page address pointer to page start address. This pointer is used to define the current read/write page address in graphic display data RAM. If vertical address increment mode is enabled by command 20h, after finishing read/write one page data, it is incremented automatically to the next page address. Whenever the page address pointer finishes accessing the end page address, it is reset back to start page address.

The figure below shows the way of column and page address pointer movement through the example: column start address is set to 2 and column end address is set to 129, page start address is set to 1 and page end address is set to 6; Horizontal address increment mode is enabled by command 20h. In this case, the graphic display data RAM column accessible range is from column 2 to column 129 and from page 1 to page 6 only. In addition, the column address pointer is set to 2 and page address pointer is set to 1. After finishing read/write one pixel of data, the column address is increased automatically by 1 to access the next RAM location for next read/write operation (*solid line in Figure 10-5*). Whenever the column address pointer finishes accessing the end column 129, it is reset back to column 2 and page address is automatically increased by 1 (*solid line in Figure 10-5*). While the end page 6 and end column 129 RAM location is accessed, the page address is reset back to 1 and the column address is reset back to 2 (*dotted line in Figure 10-5*). .

Figure 10-5 : Example of Column and Row Address Pointer Movement



10.1.6 Set Display Start Line (40h~7Fh)

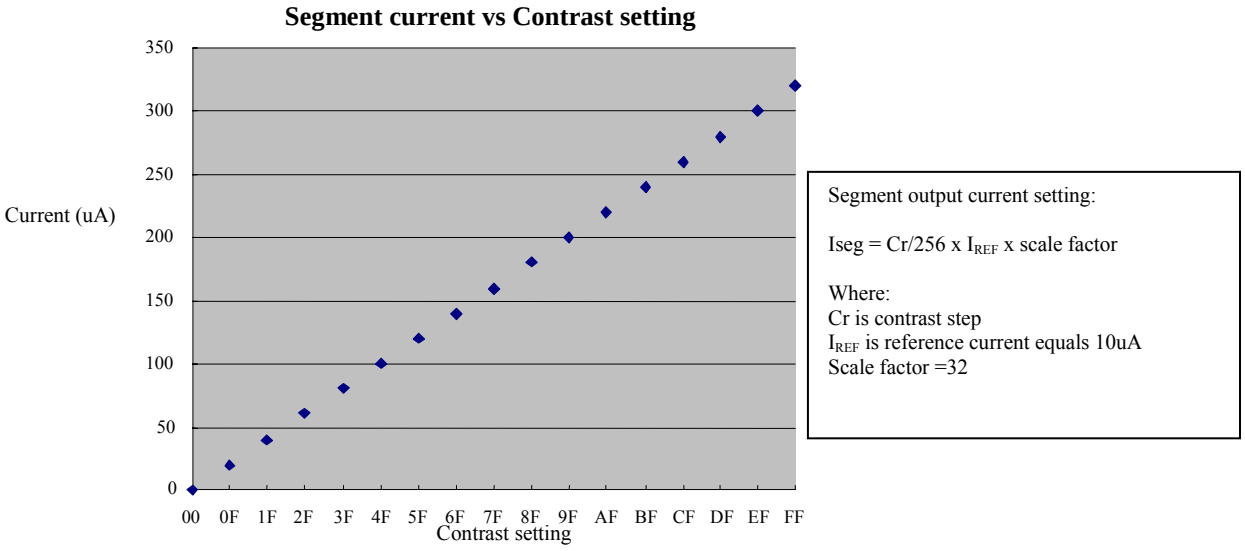
This command sets the Display Start Line register to determine starting address of display RAM, by selecting a value from 0 to 63. With value equal to 0, RAM row 0 is mapped to COM0. With value equal to 1, RAM row 1 is mapped to COM0 and so on.

Refer to Table 10-1 for more illustrations.

10.1.7 Set Contrast Control for BANK0 (81h)

This command sets the Contrast Setting of the display. The chip has 256 contrast steps from 00h to FFh. The segment output current increases as the contrast step value increases. See Figure 10-6 below.

Figure 10-6 : Segment current vs Contrast setting



10.1.8 Set Brightness for Area Color Banks (82h)

This command sets the Brightness Setting of the display for the area color banks. The chip has 256 brightness steps from 00h to FFh. The segment output current increases as the brightness step value increases.

This setting does not affect the contrast of BANK0, which is set by command 81h.

10.1.9 Set Look Up Table (LUT) (91h)

The SSD1305 provides 4 color settings - Colors A, B, C and D for the bank color of BANK1 to BANK32 under the area color mode. The color intensity (or grey scale) is defined by the current drive pulse width. This pulse width setting must be stored in the Look Up Table (LUT). The pulse width of colors A, B, C is programmable from 32 to 64 DCLKs. The color D is fixed at 64 DCLKs pulse width. For the grey scale in BANK0, the pulse width is programmable from 32 to 64 DCLKs. Please refer to 91h command in Table 9-1 for details of the LUT setting.

After setting the pulse widths for the color of A, B, C, D and BANK0, the next step is to define the color of each display area. Each bank can be programmable to any one of the 4 colors (A, B, C and D). The user can use 92h and 93h commands for the bank color setting. It should be notice that this is only applicable in area color mode.

10.1.10 Set Bank Color of BANK1 to BANK16 (PAGE0) (92h)

This command maps the bank color (pulse width) of BANK1~BANK16 to any one of the 4 colors: A, B, C and D. For details of the setting, please refer to 92h command in Table 9-1.

10.1.11 Set Bank Color of BANK17 to BANK32 (PAGE0) (93h)

This command maps the bank color (pulse width) of BANK17~BANK32 to any one of the 4 colors: A, B, C and D. For details of the setting, please refer to 93h command in Table 9-1.

10.1.12 Set Segment Re-map (A0h/A1h)

This command changes the mapping between the display data column address and the segment driver. It allows flexibility in OLED module design. Please refer to Table 9-1.

This command only affects subsequent data input. Data already stored in GDDRAM will have no changes.

10.1.13 Entire Display ON (A4h/A5h)

A4h command enable display outputs according to the GDDRAM contents.
If A5h command is issued, then by using A4h command, the display will resume to the GDDRAM contents. In other words, A4h command resumes the display from entire display "ON" stage.

A5h command forces the entire display to be "ON", regardless of the contents of the display data RAM.

10.1.14 Set Normal/Inverse Display (A6h/A7h)

This command sets the display to be either normal or inverse. In normal display a RAM data of 1 indicates an "ON" pixel while in inverse display a RAM data of 0 indicates an "ON" pixel.

10.1.15 Set Multiplex Ratio (A8h)

This command switches the default 63 multiplex mode to any multiplex ratio, ranging from 16 to 63. The output pads COM0~COM63 will be switched to the corresponding COM signal.

10.1.16 Reserved (AAh)

This command is reserved.

10.1.17 Dim Mode setting (ABh)

This command contains multiple bits to configure the contrast and brightness of color bank for the display in dim mode. The brightness setting of color bank can be set different to normal mode (AFh). The display can be set in dim mode through command ACh.

10.1.18 Master Configuration (ADh)

This command selects the external V_{CC} power supply by default. As external V_{CC} power supply is selected, external V_{CC} power should be connected to the V_{CC} pin.

10.1.19 Set Display ON/OFF (ACh/AEh/AFh)

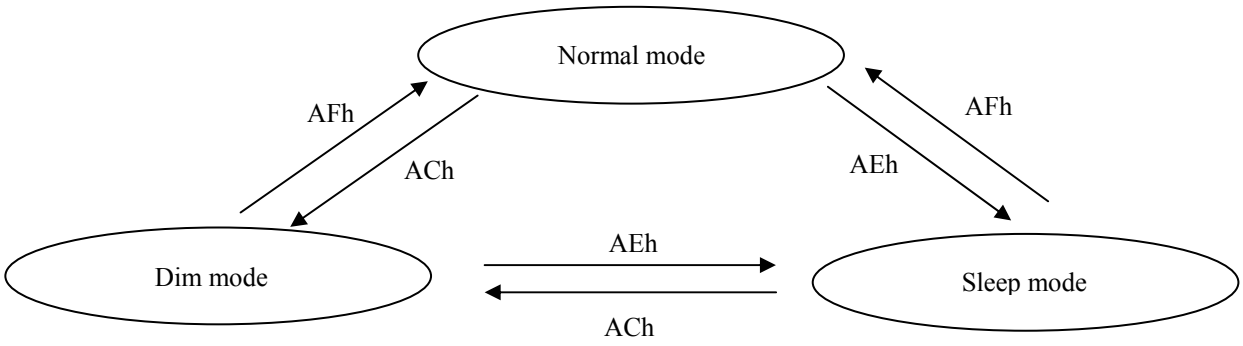
These single byte commands are used to turn the OLED panel display ON or OFF.
When the display is ON, the selected circuits by Set Master Configuration command will be turned ON.
When the display is OFF, those circuits will be turned OFF and the segment and common output are in high impedance state.

These commands set the display to one of the three states:

- ACh : Dim Mode Display ON
- AEh : Display OFF
- AFh : Normal Brightness Display ON

where the dim mode settings are controlled by command ABh.

Figure 10-7 :Transition between different modes



10.1.20 Set Page Start Address for Page Addressing Mode (B0h~B7h)

This command positions the page start address from 0 to 7 in GDDRAM under Page Addressing Mode. Please refer to Table 9-1 and Section 10.1.3 for details.

10.1.21 Set COM Output Scan Direction (C0h/C8h)

This command sets the scan direction of the COM output, allowing layout flexibility in the OLED module design. Additionally, the display will show once this command is issued. For example, if this command is sent during normal display then the graphic display will be vertically flipped immediately. Please refer to Table 10-3 for details.

10.1.22 Set Display Offset (D3h)

This is a double byte command. The second command specifies the mapping of the display start line to one of COM0~COM63 (assuming that COM0 is the display start line then the display start line register is equal to 0). For example, to move the COM16 towards the COM0 direction by 16 lines the 6-bit data in the second byte should be given as 010000b. To move in the opposite direction by 16 lines the 6-bit data should be given by 64 – 16, so the second byte would be 100000b.

The following two tables (Table 10-1, Table 10-2) show the example of setting the command C0h/C8h and D3h.

Table 10-1 : Example of Set Display Offset and Display Start Line with no Remap

	Output												
	64		64		64		56		56		56		Set MUX ratio(A8h)

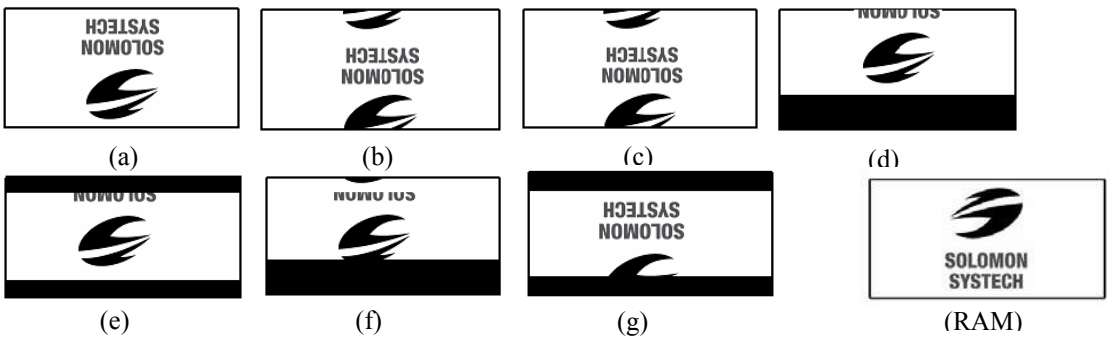
Display examples	(a)		(b)		(c)		(d)		(e)		(f)		(g)										



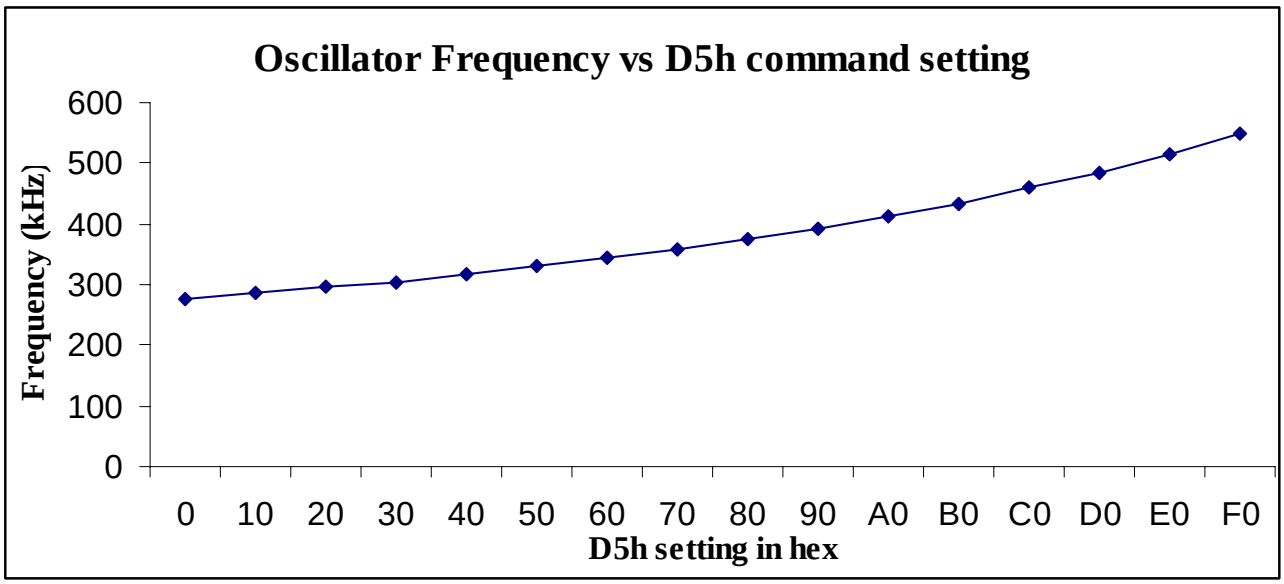
10.1.23 Set Display Clock Divide Ratio/ Oscillator Frequency (D5h)

This command consists of two functions:

- Display Clock Divide Ratio (D)(A[3:0])
  Set the divide ratio to generate DCLK (Display Clock) from CLK. The divide ratio is from 1 to 16, with reset value = 1. Please refer to section 8.3 for the details relationship of DCLK and CLK.

- Oscillator Frequency (A[7:4])
  Program the oscillator frequency Fosc that is the source of CLK if CLS pin is pulled high. The 4-bit value results in 16 different frequency settings available as shown below. The default setting is 0111b.

Figure 10-8 : Typical Oscillator frequency adjustment by D5 command (V_{DD} =2.8V)



Note
(1) There is 10% tolerance in the above frequency values

10.1.24 Set Area Color Mode ON/OFF & Low Power Display Mode (D8h)

This command is used to enable area color mode. RESET is monochrome mode. The low power display mode can reduce power consumption during IC operation.

10.1.25 Set Pre-charge Period (D9h)

This command is used to set the duration of the pre-charge period. The interval is counted in number of DCLK, where RESET equals 2 DCLKs.

10.1.26 Set COM Pins Hardware Configuration (DAh)

This command sets the COM signals pin configuration to match the OLED panel hardware layout. The table below shows the COM pin configuration under different conditions (for MUX ratio =64):

Table 10-3 : COM Pins Hardware Configuration

Conditions	COM pins Configurations
1 Sequential COM pin configuration (DAh X[4] =0) COM output Scan direction: from COM0 to COM63 (C0h) Disable COM Left/Right remap (DAh X[5] =0)	2 Sequential COM pin configuration (DAh X[4] =0) COM output Scan direction: from COM0 to COM63 (C0h) Enable COM Left/Right remap (DAh X[5] =1)	3 Sequential COM pin configuration (DAh X[4] =0) COM output Scan direction: from COM63 to COM0 (C8h) Disable COM Left/Right remap (DAh X[5] =0)	
Conditions	COM pins Configurations
4 Sequential COM pin configuration (DAh X[4] =0) COM output Scan direction: from COM63 to COM0 (C8h) Enable COM Left/Right remap (DAh X[5] =1)	5 Alternative COM pin configuration (DAh X[4] =1) COM output Scan direction: from COM0 to COM63 (C0h) Disable COM Left/Right remap (DAh X[5] =0)	6 Alternative COM pin configuration (DAh X[4] =1) COM output Scan direction: from COM0 to COM63 (C0h) Enable COM Left/Right remap (DAh X[5] =1)	
Conditions	COM pins Configurations
7 Alternative COM pin configuration (DAh X[4] =1) COM output Scan direction: from COM63 to COM0(C8h) Disable COM Left/Right remap (DAh X[5] =0)	8 Alternative COM pin configuration (DAh X[4] =1) COM output Scan direction: from COM63 to COM0(C8h) Enable COM Left/Right remap (DAh X[5] =1)	
10.1.27 Set V_{COMH} Deselect Level (DBh)

This command adjusts the V_{COMH} regulator output.

10.1.28 Enter Read Modify Write (E0h)

This single byte command is used to enter the Read Modify Write mode.
During the Read Modify Write mode:

The RAM address pointer will not be incremented when there is data read.
The RAM address pointer will be increased by one automatically after each data write.

After exit the Read Modify Write Mode by command EEh, the RAM address pointer returns back to the original location before enter the Read Modify Write mode.

For instance, when reading the data from the RAM and re-writing a new data to the same location, there is no need to re-enter the column and page addresses again under this mode.

Table 10-4 : Example of Read Modify Write Mode

Condition	RAM & address pointer (under Horizontal addressing mode)
Originally, Address Pointer point to address A	Enter Read Modify Write Mode by command E0h	
Data read : address pointer does not change	Data Write: address pointer increases by one automatically after each data write	Data Write: address pointer increases by one automatically after each data write	Data read : address pointer does not change	Data Write: address pointer increases by one automatically after each data write	Exit Read Modify Write Mode by command EEh	
Address Pointer point to address A after exit Read Modify Write Mode	
10.1.29 NOP (E3h)

No Operation Command

10.1.30 Exit Read Modify Write (EEh)

This single byte command is used to exit the Read Modify Write mode (Please refer to Section 10.1.28. for details of the Read Modify Write Mode).

10.1.31 Status register Read

This command is issued by setting D/C# ON LOW during a data read (See Figure 13-1 to Figure 13-3 for parallel interface waveform). It allows the MCU to monitor the internal status of the chip. No status read is provided for serial mode.

10.2 Graphic Acceleration Command

10.2.1 Horizontal Scroll Setup (26h/27h)

This command consists of 5 consecutive bytes to set up the horizontal scroll parameters and determines the scrolling start page, end page and scrolling speed.

Before issuing this command the horizontal scroll must be deactivated (2Eh). Otherwise, RAM content may be corrupted.

The SSD1305 horizontal scroll is designed for 132 columns scrolling. The following three figures (Figure 10-9, Figure 10-10, Figure 10-11) show the examples of using the horizontal scroll:

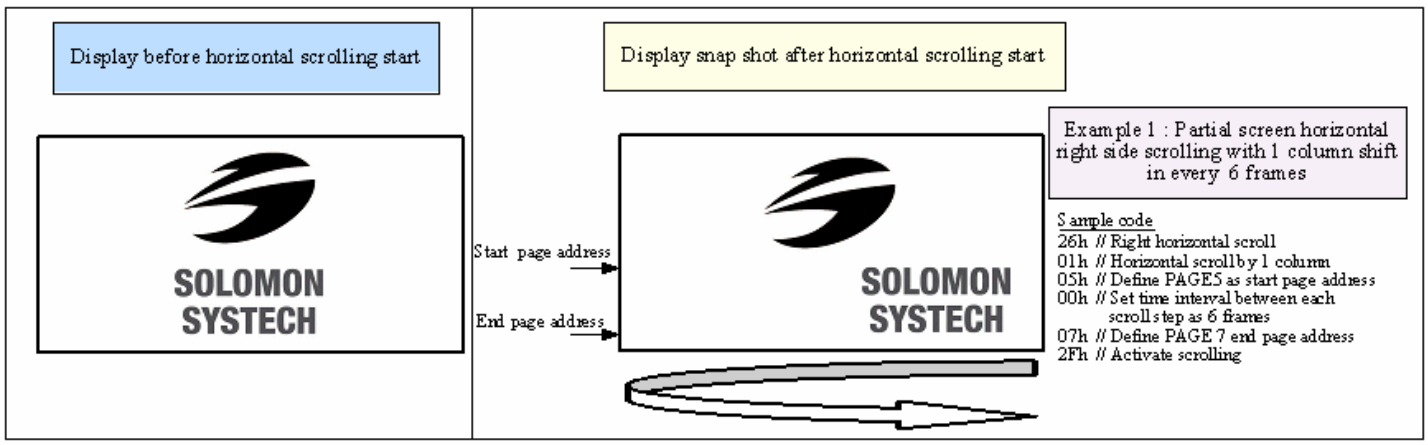
Figure 10-9 : Horizontal scroll example: Scroll RIGHT by 4 columns

Original Setting	SEG0	SEG1	SEG2	SEG3	SEG4	SEG5	…	…	…	SEG126	SEG127	SEG128	SEG129	SEG130	SEG131
After one scroll step	SEG128	SEG129	SEG130	SEG131	SEG0	SEG1	…	…	…	SEG122	SEG123	SEG124	SEG125	SEG126	SEG127

Figure 10-10 : Horizontal scroll example: Scroll LEFT by 2 columns

Original Setting	SEG0	SEG1	SEG2	SEG3	SEG4	SEG5	…	…	…	SEG126	SEG127	SEG128	SEG129	SEG130	SEG131
After one scroll step	SEG2	SEG3	SEG4	SEG5	SEG6	SEG7	…	…	…	SEG128	SEG129	SEG130	SEG131	SEG0	SEG1

Figure 10-11 : Horizontal scrolling setup example



10.2.2 Continuous Vertical and Horizontal Scroll Setup (29h/2Ah)

This command consists of 6 consecutive bytes to set up the continuous vertical and horizontal scroll parameters and determines the scrolling start page, end page, scrolling speed and vertical scrolling offset.

The bytes A[2:0], B[2:0], C[2:0] and D[2:0] of command 29h/2Ah are for the setting of the continuous horizontal scrolling. The byte E[5:0] is for the setting of the continuous vertical scrolling offset. All these bytes together are for the setting of continuous diagonal (horizontal + vertical) scrolling. If the vertical scrolling offset byte E[5:0] is set to zero, then only horizontal scrolling is performed (like command 26/27h). Alternatively, if the byte A[2:0] is set to zero and E[5:0] is not set to zero, then only vertical scrolling is performed.

Before issuing this command the scroll must be deactivated (2Eh). Otherwise, RAM content may be corrupted. The following two figures (Figure 10-12 , Figure 10-13) show the examples of using the continuous vertical and horizontal scroll:

Figure 10-12 : Continuous Vertical and Horizontal scrolling setup examples

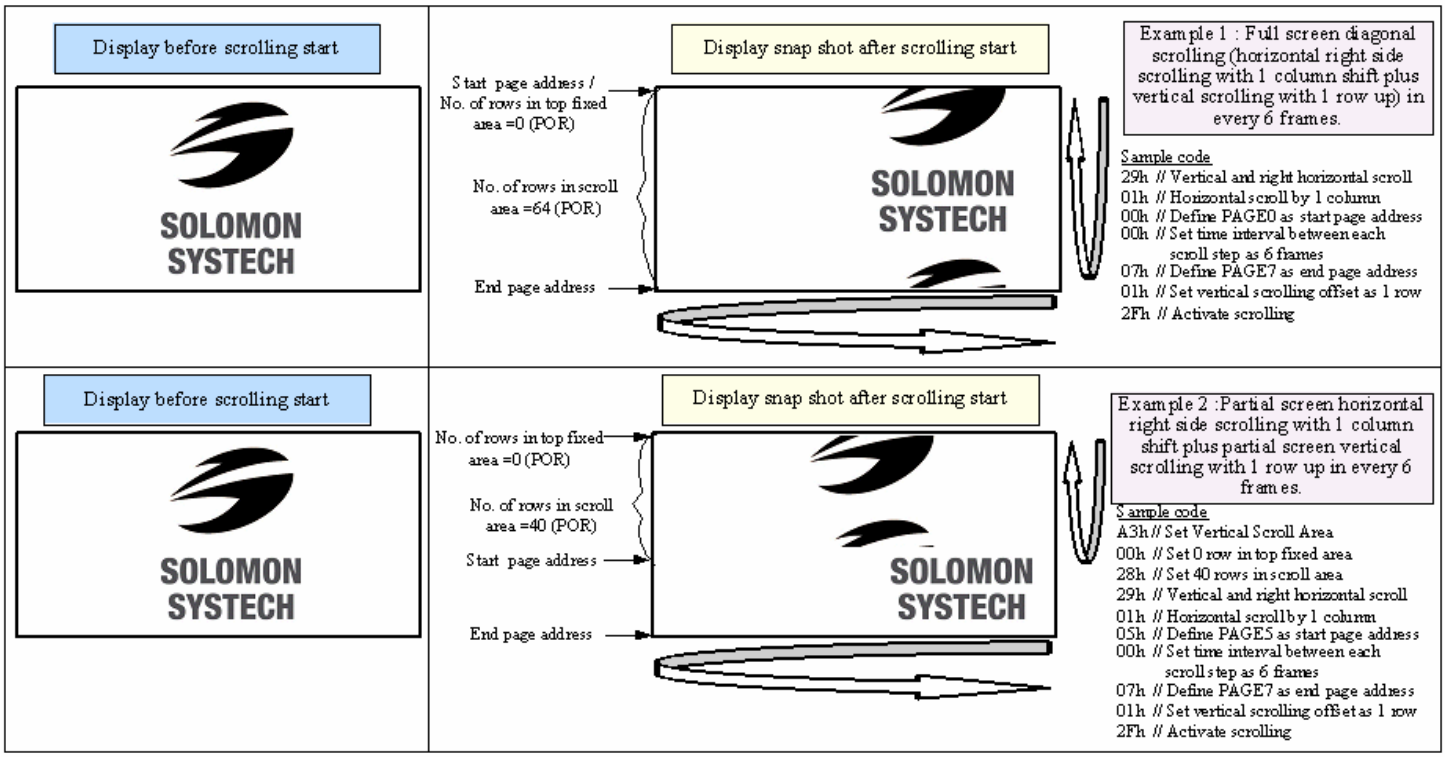


Figure 10-13 : Continuous Vertical and Horizontal scrolling example: With setting in MUX ratio

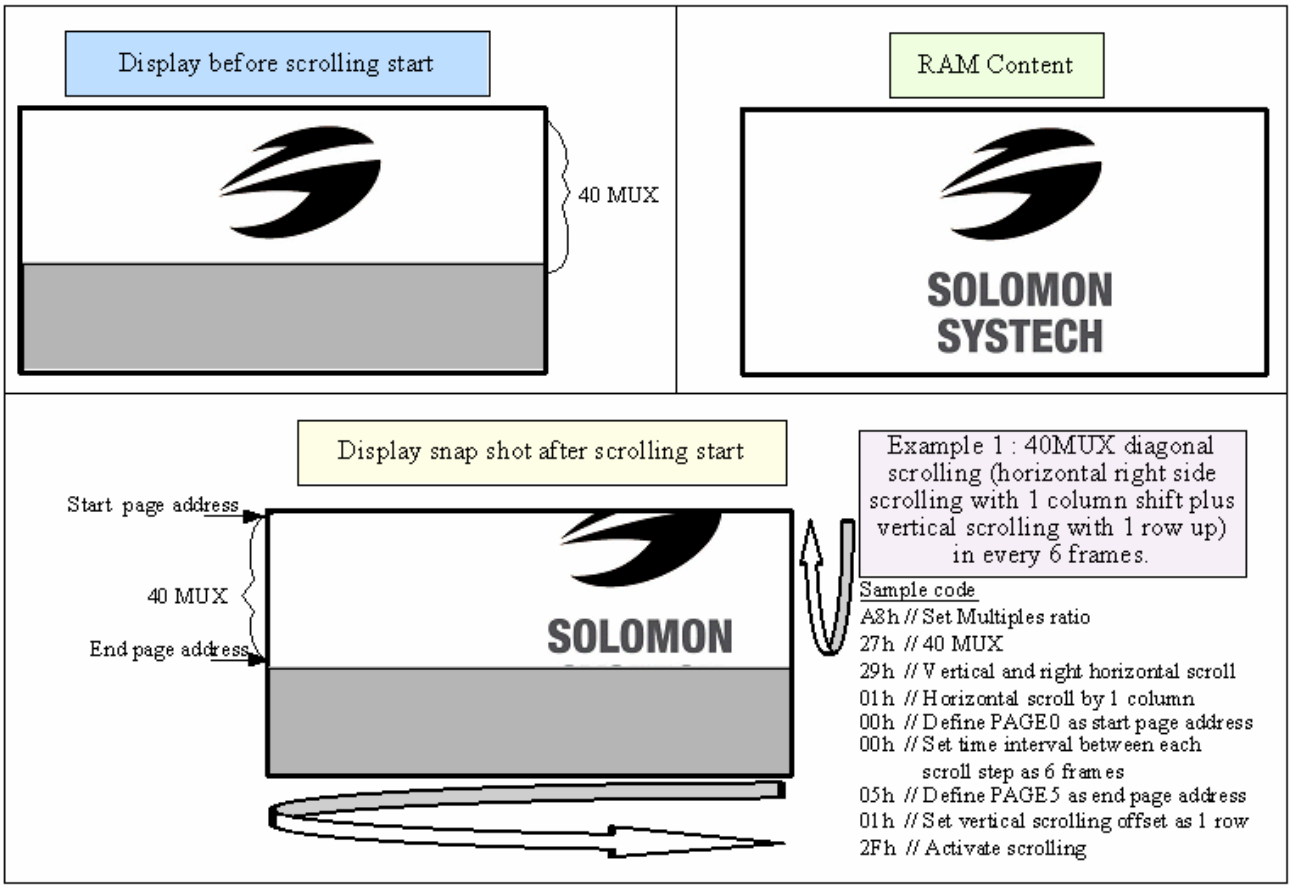
As shown in Figure 10-13, the whole RAM content is displayed during scrolling regardless of the MUX ratio.



10.2.3 Deactivate Scroll (2Eh)

This command stops the motion of scrolling. After sending 2Eh command to deactivate the scrolling action, the ram data needs to be rewritten.

10.2.4 Activate Scroll (2Fh)

This command starts the motion of scrolling and should only be issued after the scroll setup parameters have been defined by the scrolling setup commands :26h/27h/29h/2Ah . The setting in the last scrolling setup command overwrites the setting in the previous scrolling setup commands.

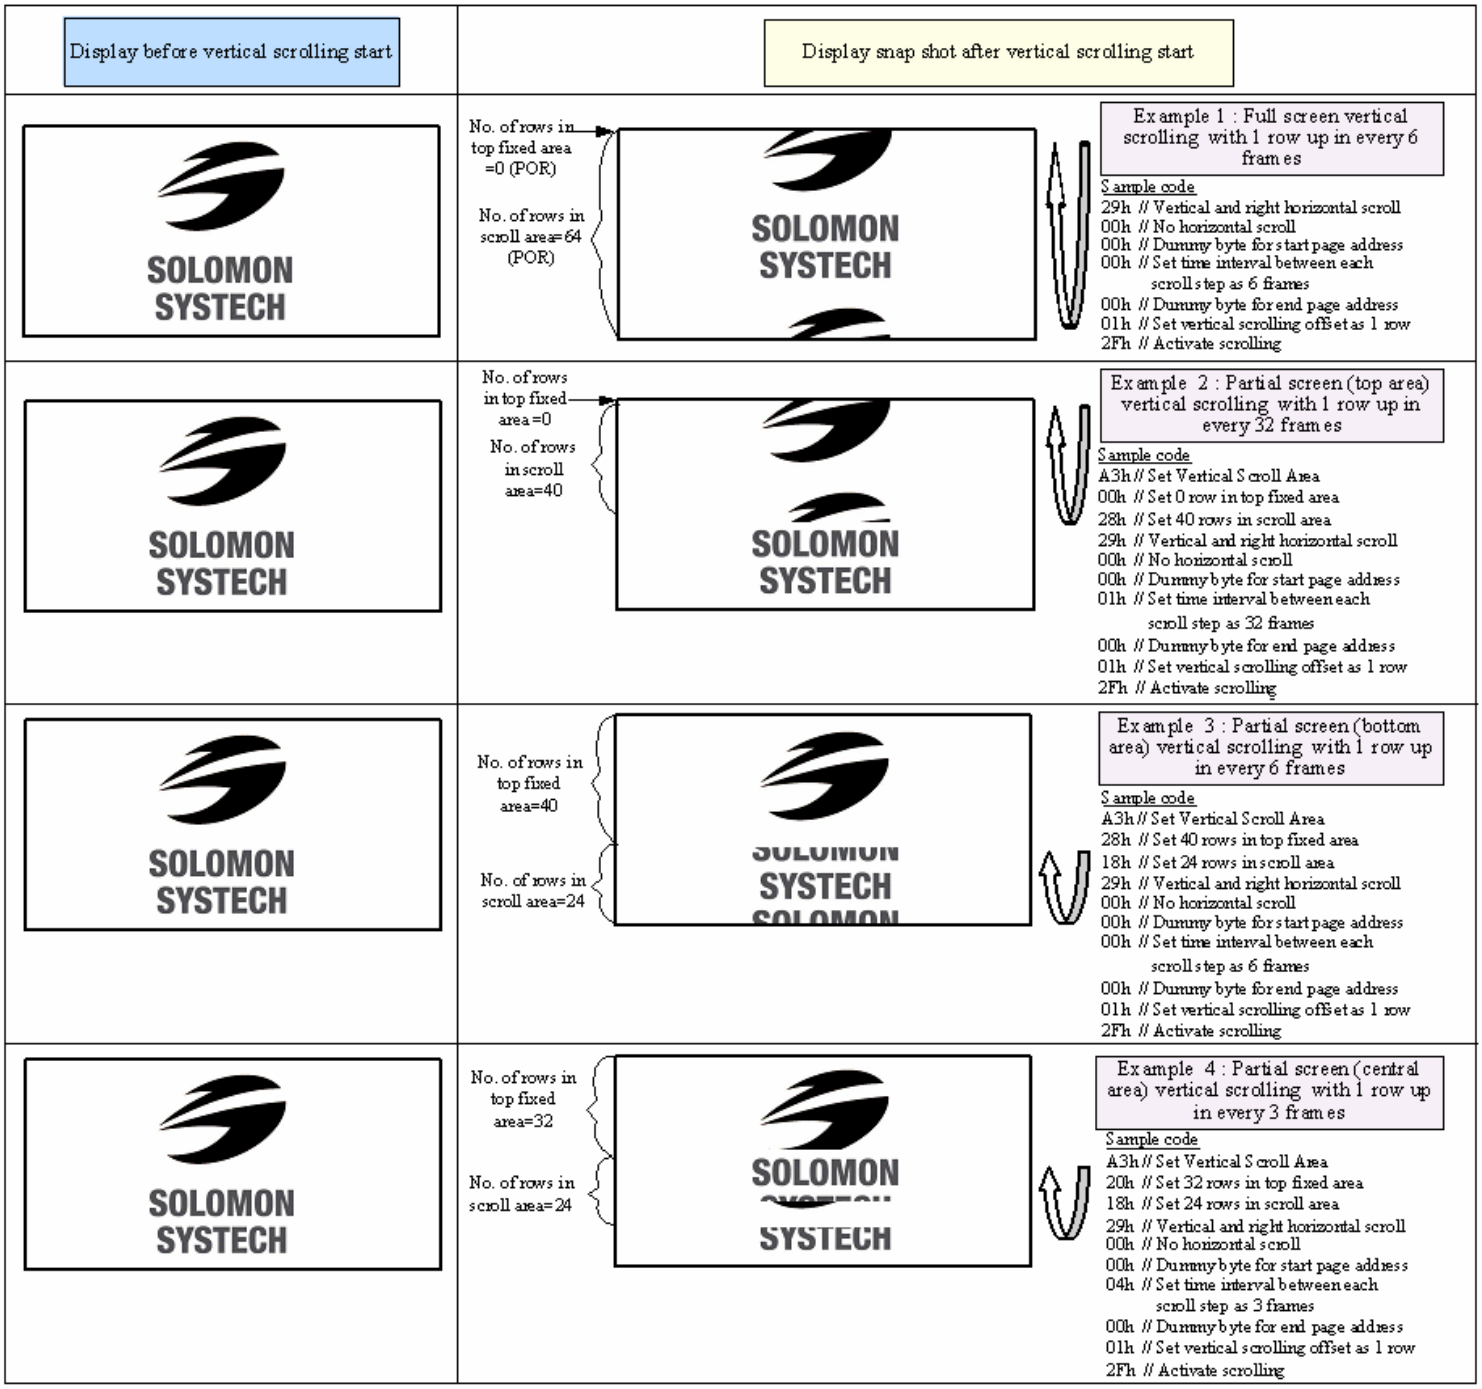
The following actions are prohibited after the scrolling is activated

1. RAM access (Data write or read)
2. Changing the horizontal scroll setup parameters

10.2.5 Set Vertical Scroll Area(A3h)

This command consists of 3 consecutive bytes to set up the vertical scroll area. For the continuous vertical scroll function (command 29/2Ah), the number of rows that in vertical scrolling can be set smaller or equal to the MUX ratio. Figure 10-14 shows some vertical scrolling example with different settings in vertical scroll area.

Figure 10-14 : Vertical scroll area setup examples



11 MAXIMUM RATINGS

Table 11-1 : Maximum Ratings (Voltage Referenced to V_{SS})

Symbol	Parameter	Value	Unit
V_{DD}	Supply Voltage	-0.3 to +4	V
V_{DDIO}		-0.3 to V_{DD}+0.5	V
V_{CC}		0 to 16	V
V_{SEG}	SEG output voltage	0 to V_{CC}	V
V_{COM}	COM output voltage	0 to 0.9*V_{CC}	V
V_{in}	Input voltage	V_{SS}-0.3 to V_{DD}+0.3	V
T_A	Operating Temperature	-40 to +85	ºC
T_{stg}	Storage Temperature Range	-65 to +150	ºC

Maximum ratings are those values beyond which damages to the device may occur. Functional operation should be restricted to the limits in the Electrical Characteristics tables or Pin Description section

This device may be light sensitive. Caution should be taken to avoid exposure of this device to any light source during normal operation. This device is not radiation protected.

12 DC CHARACTERISTICS

Condition (Unless otherwise specified):

Voltage referenced to V_{SS}

V_{DD} = 2.4 to 3.5V

T_A = 25°C

Table 12-1 : DC Characteristics

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
V_{CC}	Operating Voltage	-	7	-	15	V
V_{DD}	Logic Supply Voltage	-	2.4	-	3.5	V
V_{DDIO}	Logic Supply Voltage for MCU interface	-	1.6	-	V_{DD}	V
V_{OH}	High Logic Output Level	I_{OUT} = 100uA, 3.3MHz	0.9 x V_{DDIO}	-	-	V
V_{OL}	Low Logic Output Level	I_{OUT} = 100uA, 3.3MHz	-	-	0.1 x V_{DDIO}	V
V_{IH}	High Logic Input Level	-	0.8 x V_{DDIO}	-	-	V
V_{IL}	Low Logic Input Level	-	-	-	0.2 x V_{DDIO}	V
$I_{CC, SLEEP}$	I_{CC} Sleep mode Current	V_{DDIO} =1.6V~3.3V, V_{DD} = 2.4V ~3.5V, V_{CC} = 7V~15V Display OFF, No panel attached	-	-	10	uA
$I_{DD, SLEEP}$	I_{DD} Sleep mode Current	V_{DDIO} =1.6V~3.3V, V_{DD} = 2.4V ~3.5V, V_{CC} = 7V~15V Display OFF, No panel attached	-	-	10	uA
$I_{DDIO, SLEEP}$	I_{DDIO} Sleep mode Current	V_{DDIO} =1.6V~3.3V, V_{DD} = 2.4V ~3.5V, V_{CC} = 7V~15V Display OFF, No panel attached	-	-	10	uA
I_{CC}	V_{CC} Supply Current V_{DD} = 2.7V, V_{CC} = 12V, I_{REF} = 10uA No loading, Display ON, All ON	Contrast = FFh	-	550	1000	uA
I_{DD}	V_{DD} Supply Current V_{DD} = 2.7V, V_{CC} = 12V, I_{REF} = 10uA No loading, Display ON, All ON		-	100	300	uA
I_{SEG}	Segment Output Current V_{DD}=2.7V, V_{CC}=12V, I_{REF}=10uA, Display ON.	Contrast=FFh	294	320	346	uA
		Contrast=AFh	-	220	-	
		Contrast=7Fh	-	159	-	
		Contrast=3Fh	-	79	-	
		Contrast=0Fh	-	19	-	
Dev	Segment output current uniformity	Dev = (I_{SEG} – I_{MID})/I_{MID} I_{MID} = (I_{MAX} + I_{MIN})/2 I_{SEG}[0:131] = Segment current at contrast = FFh	-3	-	+3	%
Adj. Dev	Adjacent pin output current uniformity (contrast = FF)	Adj Dev = (I[n]-I[n+1]) / (I[n]+I[n+1])	-2	-	+2	%

13 AC CHARACTERISTICS

Conditions:

Voltage referenced to V_{SS}
V_{DD}=2.4 to3.5V
T_A = 25°C

Table 13-1 : AC Characteristics

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
F_{OSC} (1)	Oscillation Frequency of Display Timing Generator	V_{DD} = 2.8V	324	360	396	kHz
F_{FRM}	Frame Frequency for 64 MUX Mode	132x64 Graphic Display Mode, Display ON, Internal Oscillator Enabled	-	F_{OSC} x 1/(DxKx64) (2)	-	Hz
RES#	Reset low pulse width		3	-	-	us

Note

(1) F_{OSC} stands for the frequency value of the internal oscillator and the value is measured when command D5h A[7:4] is in default value.

(2) D: divide ratio (default value = 1)
K: number of display clocks (default value = 54)
Please refer to Table 9-1 (Set Display Clock Divide Ratio/Oscillator Frequency, D5h) for detailed description

Table 13-2 : 6800-Series MCU Parallel Interface Timing Characteristics

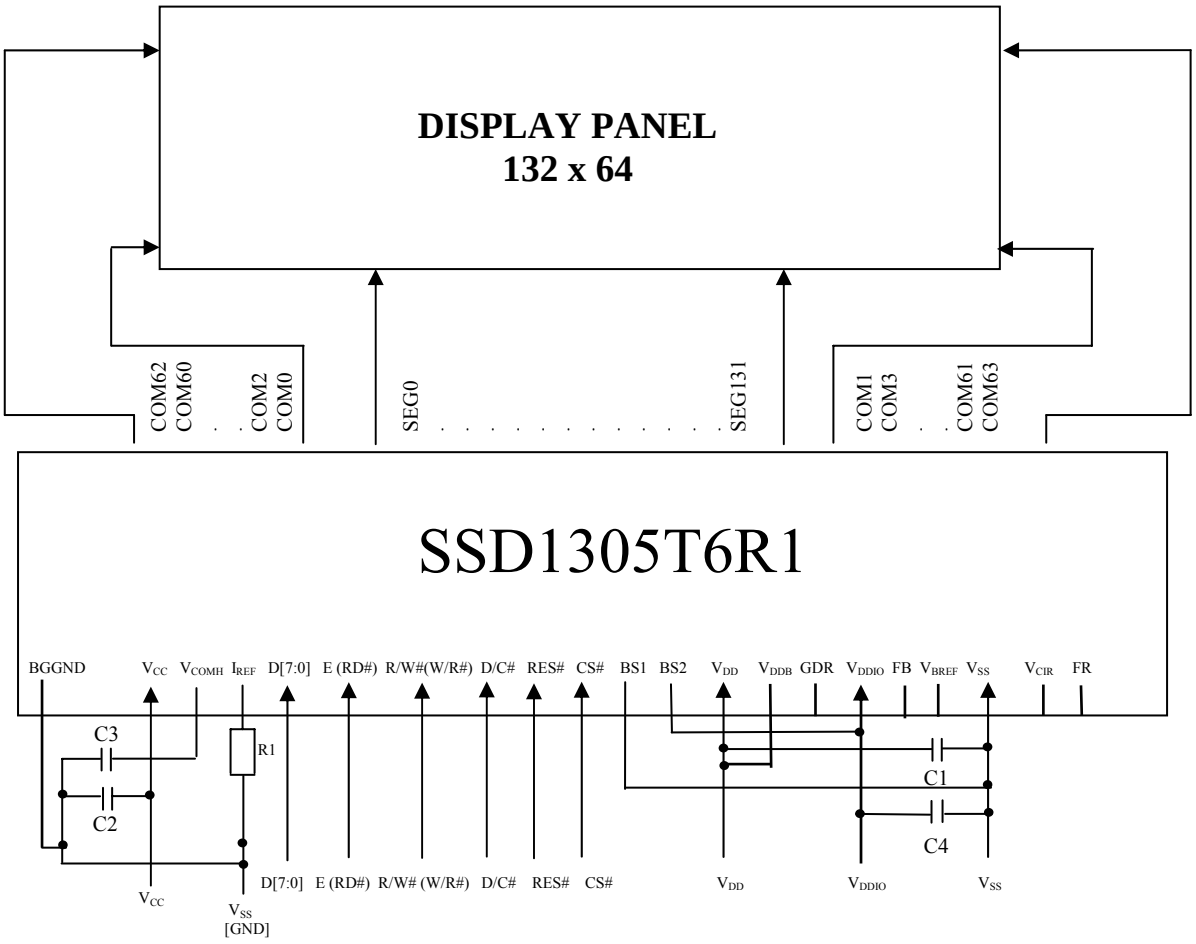
14 APPLICATION EXAMPLE

Figure 14-1 : Application Example of SSD1305T6R1

The configuration for 6800-parallel interface mode, external V_{CC} is shown in the following diagram:
(V_{DD}=2.7V, V_{CC} =12V, I_{REF}=10uA)



Pin connected to MCU interface: D[7:0], E, R/W#, D/C#, CS#, RES#
Pin internally connected to V_{SS}: BS0, V_{SSB}
GDR, V_{BREF}, FB should be left open.

C1: 4.7uF (1)
C2: 4.7uF (1)
C3: 4.7uF (1)
C4: 4.7uF (1)

R1: 910kΩ, R1= (Voltage at I_{REF} pin-V_{SS})/I_{REF}
Voltage at I_{REF} pin = V_{CC}-3V

Note
(1) The capacitor value is recommended value. Select appropriate value against module application.
