

# **GT23L24T3Y**

## **Standard Chinese Font Chip**

### **DATASHEET**

- Font size: 11X12dots、15X16dots、24X24dots
- Chinese character set: GB2312、GB12345、BIG5
- Compatible with Unicode
- Input method code list:

GT 3D IDEOGRAPH (GB2312)

GT PINYIN (GB2312)

GT 3D IDEOGRAPH (BIG5)

GT ZHUYIN (BIG5)

- Data arrangement: vertical byte, horizontal string
- Bus interface: SPI serial bus

PLII simplified address Parallel bus

- Chip package: SO20W

**VER 3.5**

2010-Q3

# 1 General

GT23L24T3Y is a Chinese font chip (with official license). It includes 11X12 dots, 15X16 dots, 24X24 dots. It supports GB2312 national standard character set, GB12345 national standard traditional character set, BIG5 traditional character set, and ASCII character, also compatible with Unicode. The data arrangement is byte vertical, string horizontal. The user can find the address of certain character dot matrix in the chip via the method provided by this datasheet.

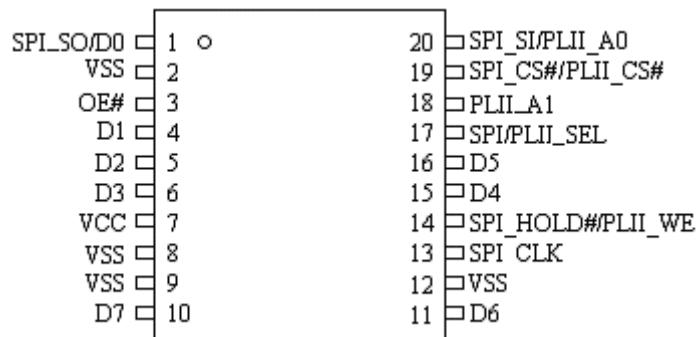

This chip contains 3 Chinese input method code list:

1. GT PINYIN
2. GT 3D IDEOGRAPH
3. GT ZHUYIN (BIG5 only)

Along with the Chinese input method program provided by Genitop, it allows quick Chinese input with numeral keyboard on handheld IT equipment.

## 1.1 Chip Feature

- Bus interface: SPI serial bus
  - PLII simplified address Parallel bus
- Data arrangement: byte vertical, string horizontal
- SPI access time: 20MHz(max.) @3.3V
- PLII access time: 130ns(max.) @3.3V
- Supply voltage: 2.7V~3.6V
- Current:
  - Operating: 12mA
  - Standby: 10uA
- Package: SO20W
- Package Size(SO20W): 12.80mmX10.30mm
- Operating Temperature: -20°C~85°C (in SPI mode); -10°C~85°C (in PLII mode)

11	D6	No Connection	Data Outputs
12	VSS	Ground	
13	SPI_CLK	Serial clock input	No Connection
14	SPI_HOLD#/PLII_WE	Hold(to pause the device)	Write Enable Input
15	D4	No Connection	Data Outputs
16	D5	No Connection	Data Outputs
17	SPI/PLII_SEL	SPI/PLII SELECT	
		NC: SPI	GND: PLII
18	PLII_A1	No Connection	Address Inputs
19	SPI_CS#/PLII_CS#	Chip enable input	Chip Enable Input
20	SPI_SI/PLII_A0	Serial data input	Address Inputs

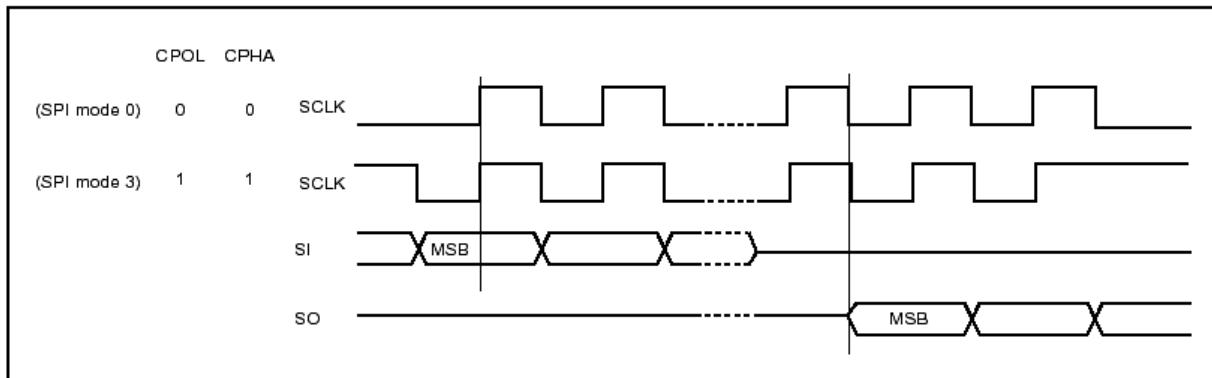

### 2.2 SPI interface description

Serial data output(SO): Data is shifted out on the falling edge of the serial clock.

Serial data input(SI) : Inputs are latched on the rising edge of the serial clock.

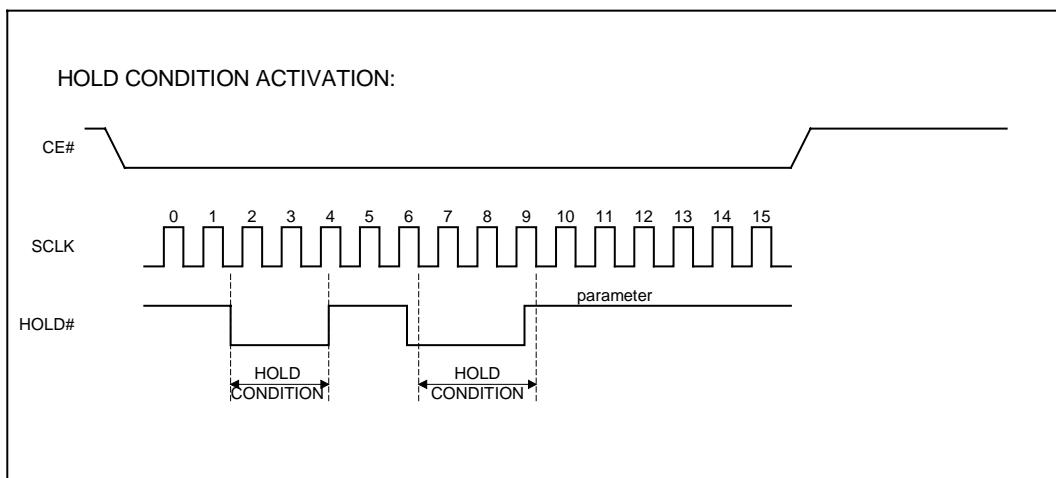

Serial clock input(SCLK): To provide the timing of the serial interface.

Chip enable input(CS#): The device is enabled by a high to low transition on CS#. CS# must remain low for the duration of any command sequence.

**HOLD#:** To temporarily stop serial communication with SPI flash memory without resetting the device.

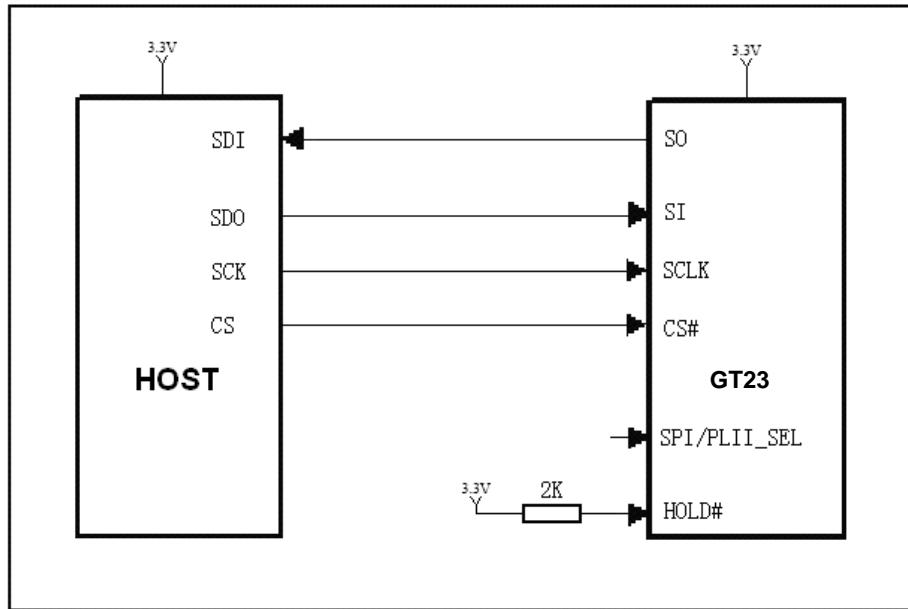

The HOLD# mode begins when the SCK active low state coincides with the falling edge of the HOLD# signal. The HOLD mode ends when the HOLD# signal's rising edge coincides with the SCK active low state.

## 2.3 SPI connection block diagram

When SPI/PLII\_SEL is not connected, the chip is at SPI bus mode.

HOLD# PIN should pulled to 3.3V through 2K resistor

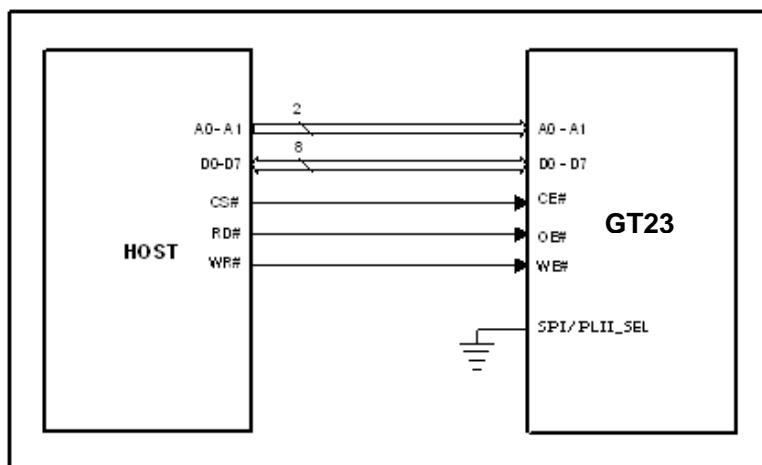

## 2.4 PLII bus description

Pin name	I/O	description
A[1..0]	I	address register
D[7..0]	I/O	Address input / data output
CE#	I	Chip enable input,
OE#	I	Output enable input
WE#	I	Write enable input

## 2.5 PLII bus connection block diagram

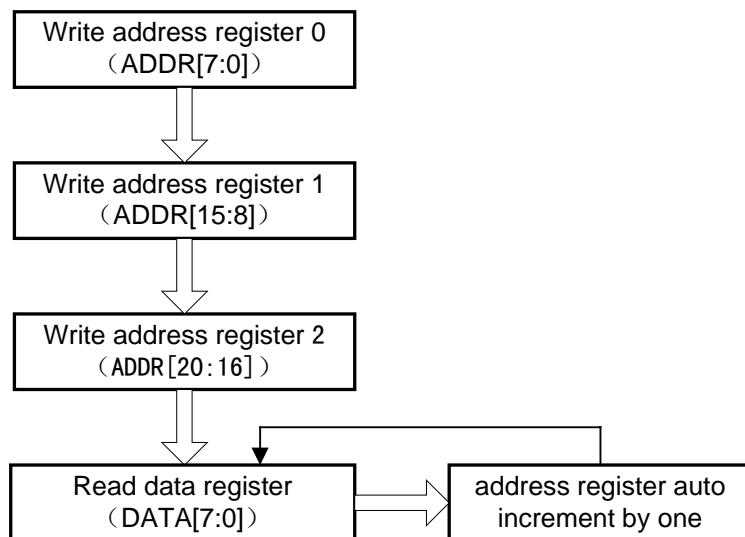

When SPI/PLII\_SEL is connected to ground, the chip is at PLII bus mode.

## 2.6 PLII bus address access operation

In PLII BUS mode, there are 3 address register in ROM chip, the host CPU will write the address of the read data into these 3 address register, then read the data from data register. Every time the host CPU reads data register, the address in address register will automatically add one to itself. When the host CPU obtains the first address, it will read the other data consecutively in data string. Once the chip is powered on, address register will reset.

A1 A0 (address)	operation	register
0 0	write	Address register 0 [ADDR7:0]
0 1	write	Address register 1 [ADDR15:8]
1 0	write	Address register 2 [ADDR20:16]
0 0	read	Data register [DATA7:0]

## 3 Operating instruction

### 3.1 SPI bus operating instruction

Instruction Set

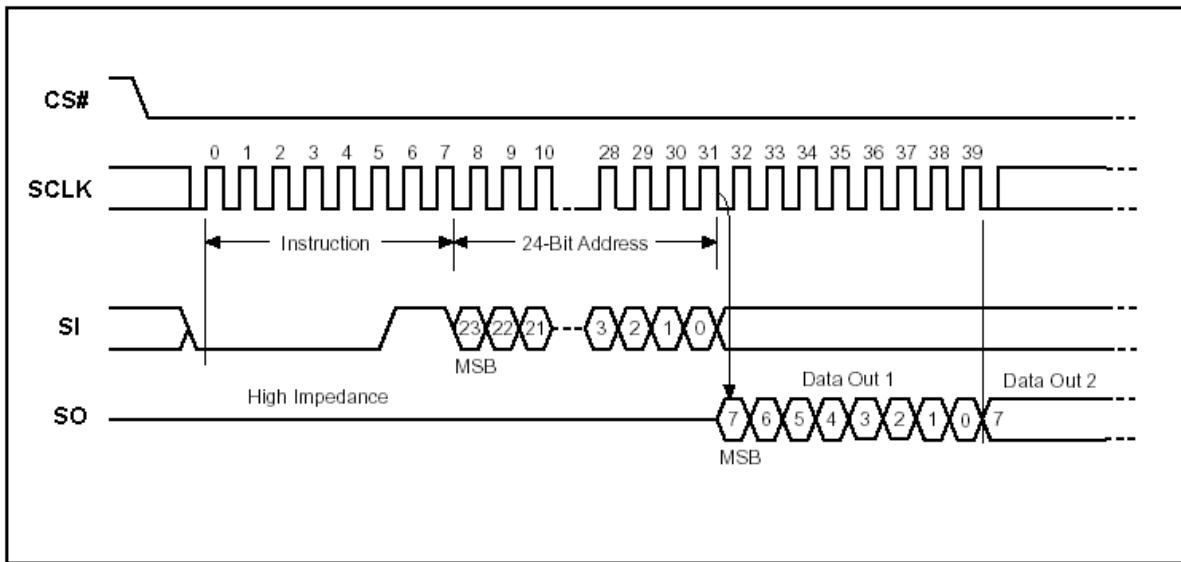

Instruction	Description	Instruction Code(One-Byte)	Address Bytes	Dummy Bytes	Data Bytes
READ	Read Data Bytes	0000 0011	03 h	3	—
FAST_READ	Read Data Bytes at Higher Speed	0000 1011	0B h	3	1

#### 3.1.1 Read Data Bytes

The Read instruction supports up to 20 MHz, It outputs the data starting from the specified address location. The data output stream is continuous through all addresses until terminated by a low to high transition on CE#. The internal address pointer will automatically increment.

The Read instruction is initiated by executing an 8-bit command,03H, followed by address bits [A23-A0]. CE# must remain active low for the duration of the Read cycle.

Figure: Read Data Bytes (READ) Instruction Sequence and Data-outsequence:

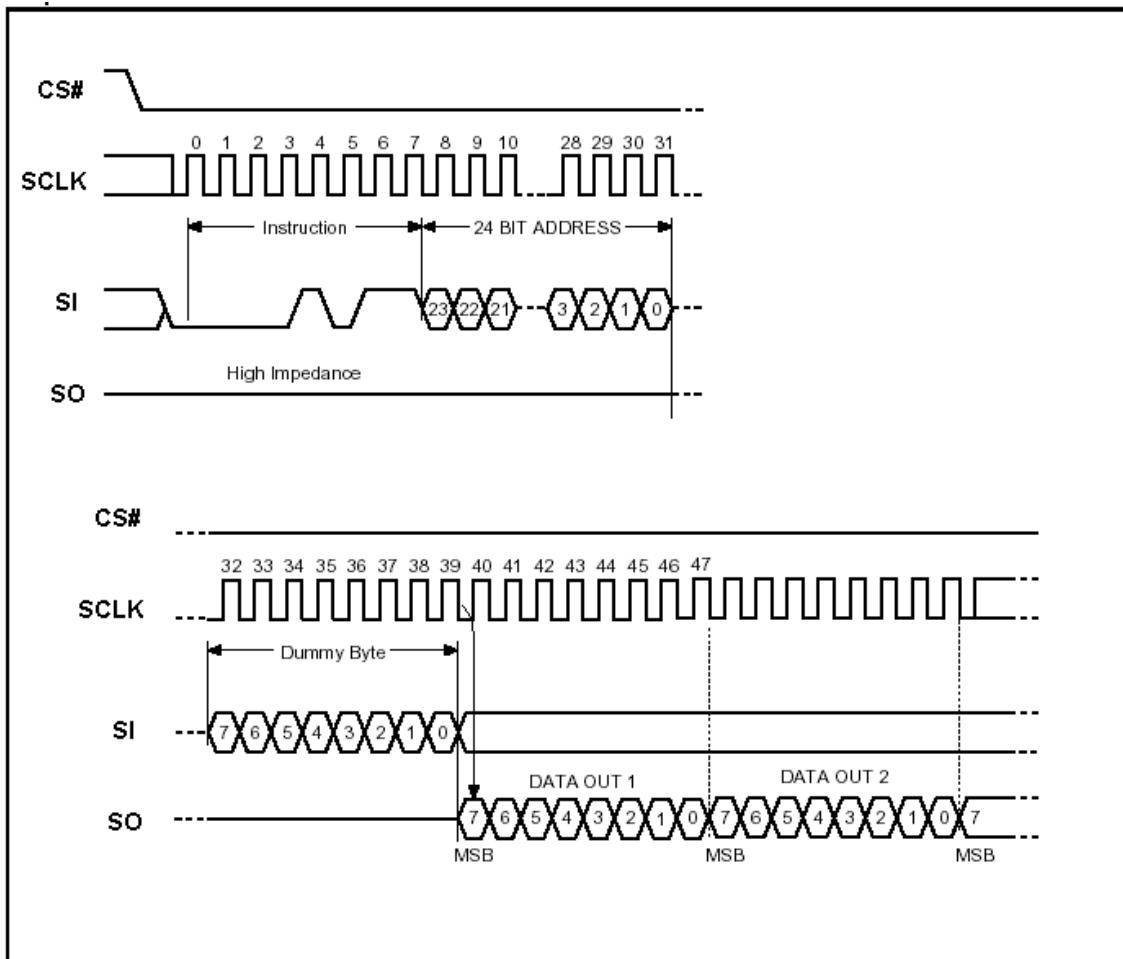

#### 3.1.2 Read Data Bytes at Higher Speed

The High-Speed-Read instruction supporting up to 30 MHz is initiated by executing an 8-bit command, 0BH, followed by address bits [A23-A0] and a dummy byte. CE# must remain active low for the duration of the High-Speed-Read cycle.

Following a dummy byte (8 clocks input dummy cycle), the High-Speed-Read instruction outputs the data starting from the specified address location. The data output stream is continuous through all addresses until terminated by a low to high transition on CE#. The internal address pointer will automatically increment.

Read Data Bytes at Higher Speed (READ\_FAST) Instruction Sequence and Data-out

sequence:

### 3.2 PLII Operating instruction

PLII Bus doesn't need a great amount of I/O pin for address bus when it uses the address decoder and the latch built in ROM chip. This allows transfer speed to reach parallel bus speed with only 2 I/O pin for address (A0-A1).

In PLII BUS mode, there are 3 address register in ROM chip, the host CPU will write the address of the read data into these 3 address register, then read the data from data register. Every time the host CPU reads data register, the address in address register will automatically add one to itself. When the host CPU obtains the first address, it will read the other data consecutively in data string. Once the chip is powered on, address register will reset.

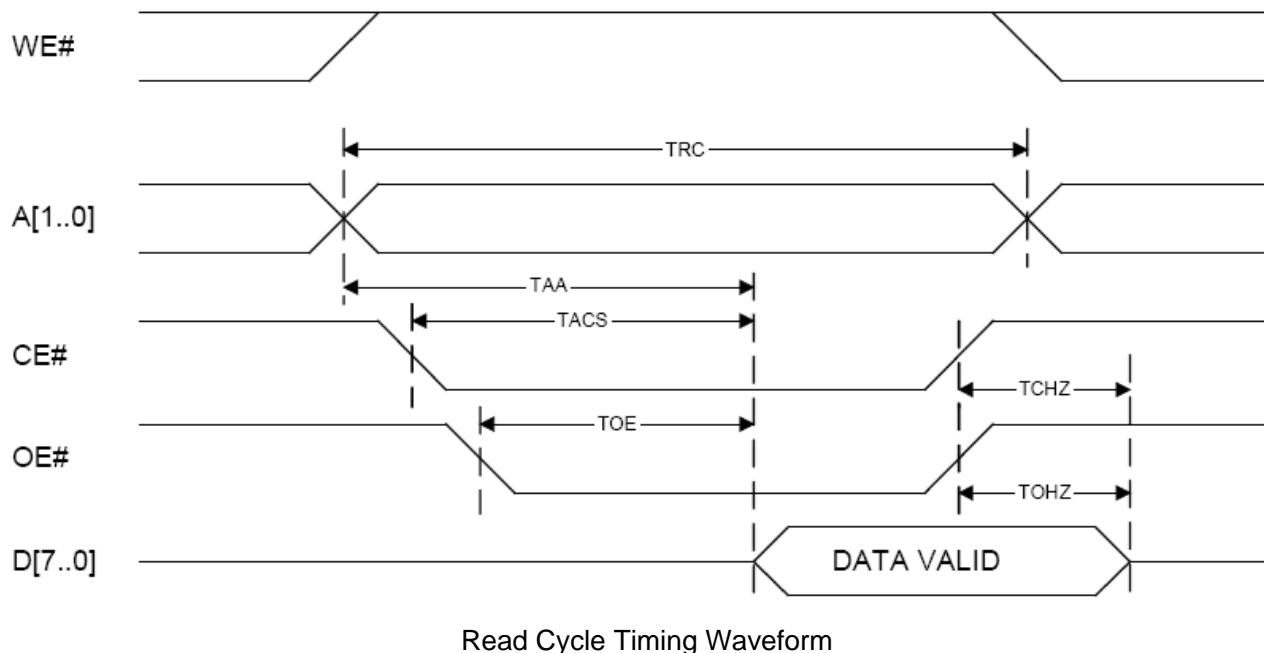

#### 3.2.1 Pin description

Pin name	I/O	描述
A[1..0]	I	address register
D[7..0]	I/O	Address input / data output
CE#	I	Chip enable input,
OE#	I	Output enable input
WE#	I	Write enable input

Truth table

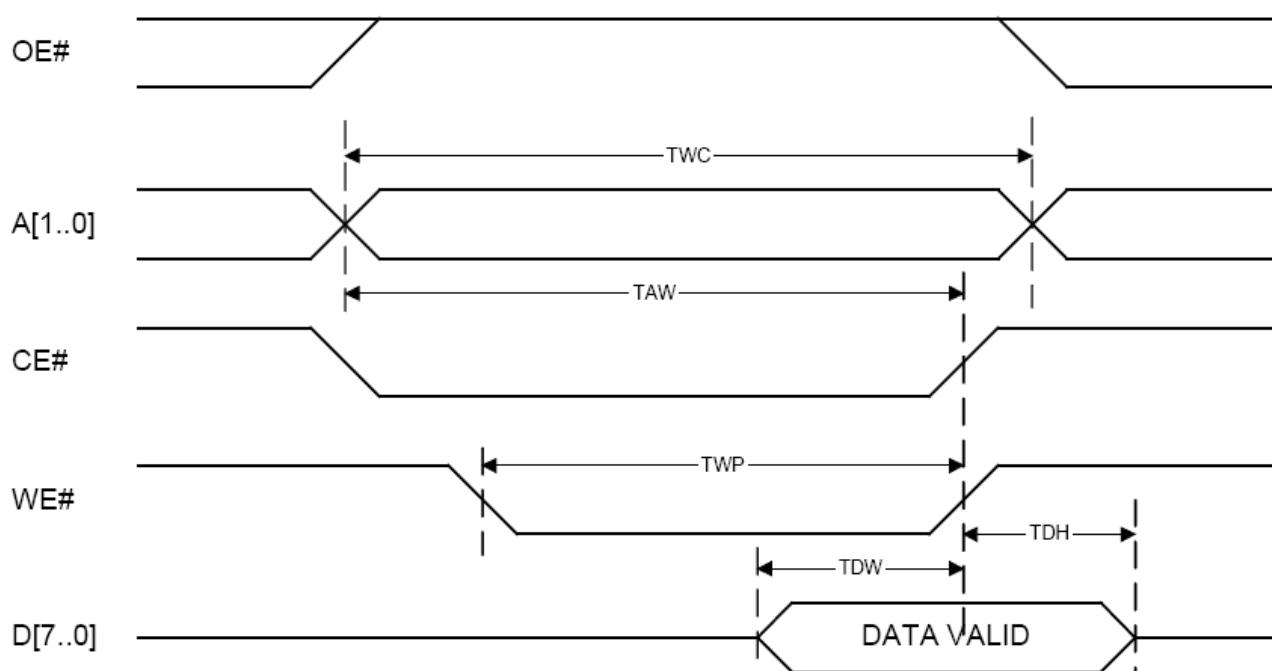

Mode	CE#	OE#	WE#	D[7..0]
Other	H	X	X	High-Z

## 4 Electric characteristic

### 4.1 Absolute maximum rating

Symbol	Parameter	Min.	Max.	Unit	Condition
T <sub>OP</sub>	Operating Temperature	-20	85	°C	In SPI mode
T <sub>OP</sub>	Operating Temperature	-10	85	°C	In PLII mode
T <sub>STG</sub>	Storage Temperature	-65	125	°C	
V <sub>C</sub>	Supply Voltage	-0.3	3.6	V	
V <sub>IN</sub>	Input Voltage	-0.5	VCC+0.5	V	
GND	Power Ground	0	0	V	

### 4.2 DC Feature

Condition: T<sub>OP</sub> = -20°C to 85°C, GND=0V in SPI mode; T<sub>OP</sub> = -10°C to 85°C, GND=0V in PLII mode

Symbol	Parameter	Min.	Max.	Unit	Condition
I <sub>DD</sub>	VCC Supply Current(active)		12	mA	VCC=2.7-3.6V
I <sub>SB</sub>	VCC Standby Current		10	uA	
V <sub>IL</sub>	Input LOW Voltage	-0.3	0.6	V	
V <sub>IH</sub>	Input HIGH Voltage	0.7VCC	VCC+0.3	V	
V <sub>OL</sub>	Output LOW Voltage		0.4 (I <sub>OL</sub> =1.6mA)	V	
V <sub>OH</sub>	Output HIGH Voltage	0.8VCC (I <sub>OH</sub> =-0.4mA)		V	
I <sub>LI</sub>	Input Leakage Current	0	+10	uA	
I <sub>LO</sub>	Output Leakage Current	0	+10	uA	

Note: I<sub>IL</sub>: Input LOW Current, I<sub>IH</sub>: Input HIGH Current,

I<sub>OL</sub>: Output LOW Current, I<sub>OH</sub>: Output HIGH Current,

### 4.3 AC characteristic

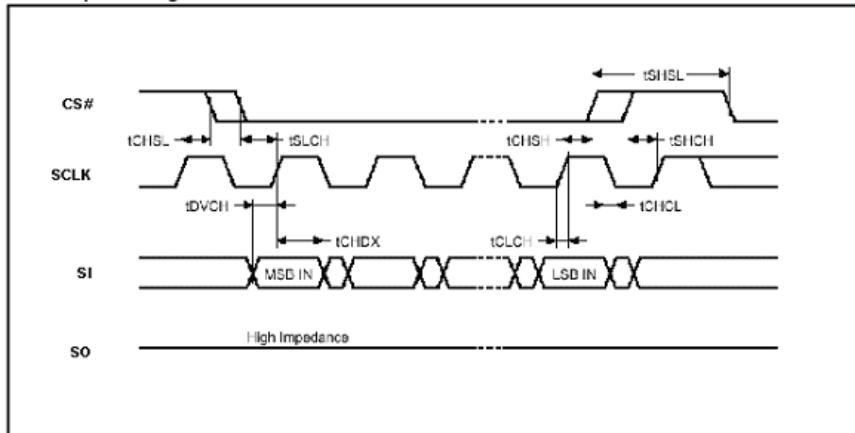

#### 4.3.1 SPI bus AC characteristic

Condition: T<sub>OP</sub> = -20°C to 85°C, VCC= 2.7V to 3.6V

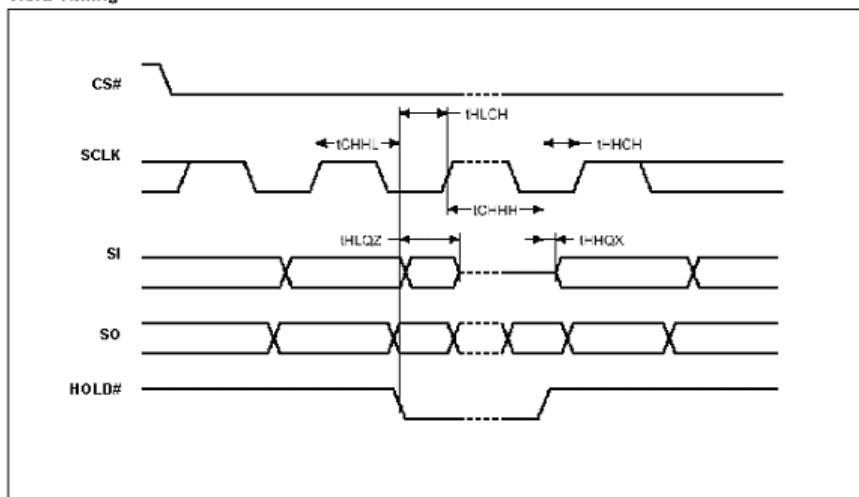

Symbol	Alt.	Parameter	Min.	Max.	Unit
F <sub>c</sub>	F <sub>c</sub>	Clock Frequency	D.C.	20	MHz
t <sub>CH</sub>	t <sub>CLH</sub>	Clock High Time	20		ns

## 6 Font Read Method

### 6.1 Character dots arrangement

The data arrangement is byte horizontal, string horizontal. The highest Bit of BYTE represent left point, the lowest Bit of BYTE represent right point.

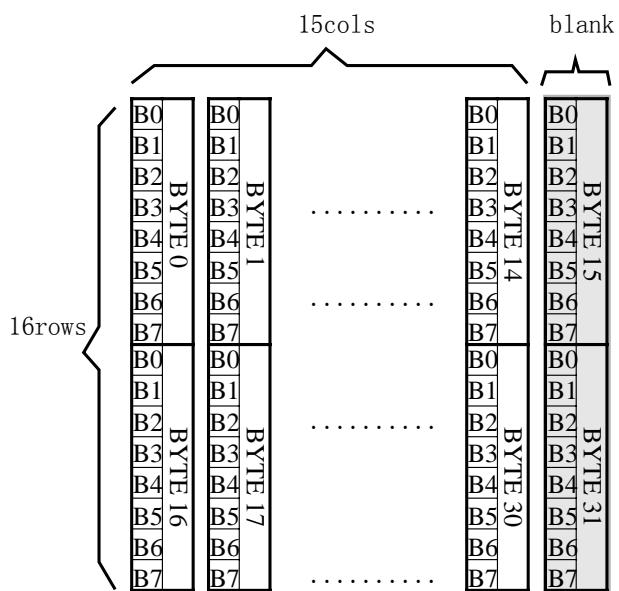

#### 6.1.1 11X12 dots font

11X12 dots font has 24 bytes (BYTE 0 – BYTE 23) data.

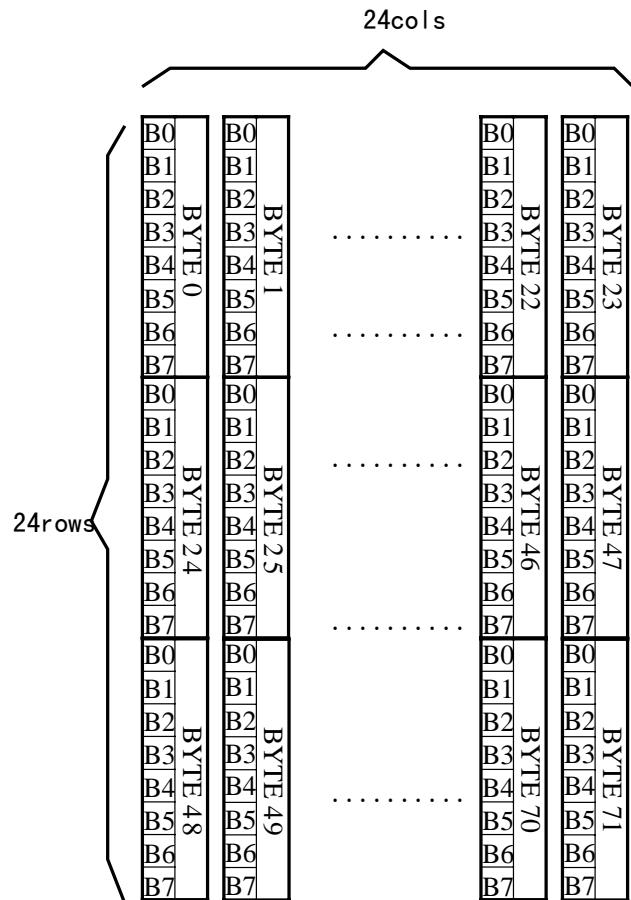

#### 6.1.2 15X16 dots font

15X16 dots font has 32 bytes (BYTE 0 – BYTE 31) data.

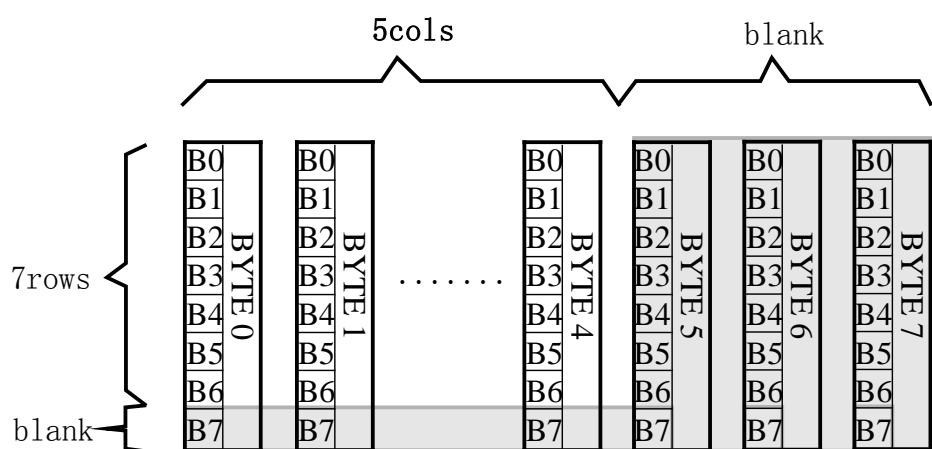

### 6.1.3 24X24 dots font

24X24 dots font has 72 bytes (BYTE 0 – BYTE 71) data.

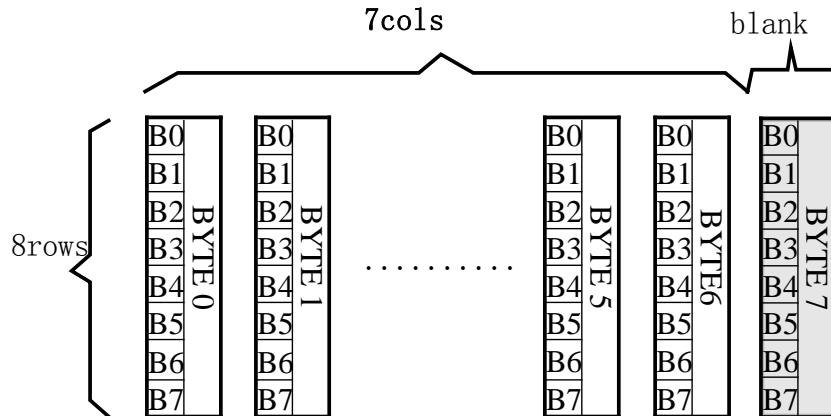

### 6.1.4 5X7 dots ASCII font

5X7 dots ASCII font has 8 bytes (BYTE 0 – BYTE7) data.

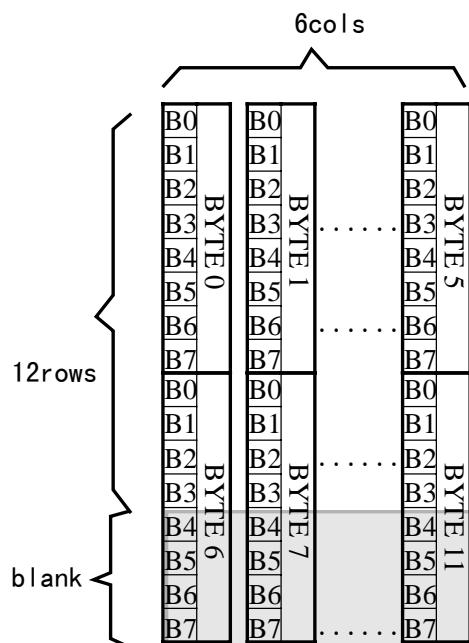

### 6.1.5 7X8 dots ASCII font

7X8 dots ASCII font has 8 bytes (BYTE 0 – BYTE7) data.

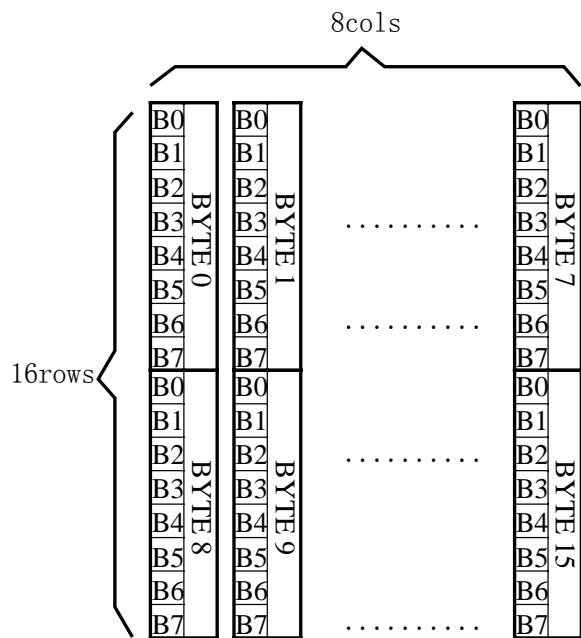

### 6.1.6 6X12 dots ASCII font

6X12 dots ASCII font has 12 bytes (BYTE 0 – BYTE11) data.

### 6.1.7 8X16 dots font

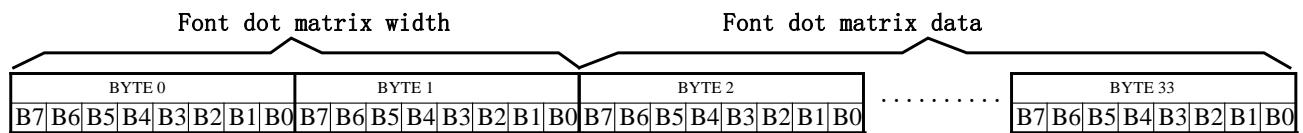

8X16 dots font has 16 bytes (BYTE 0 – BYTE15) data:

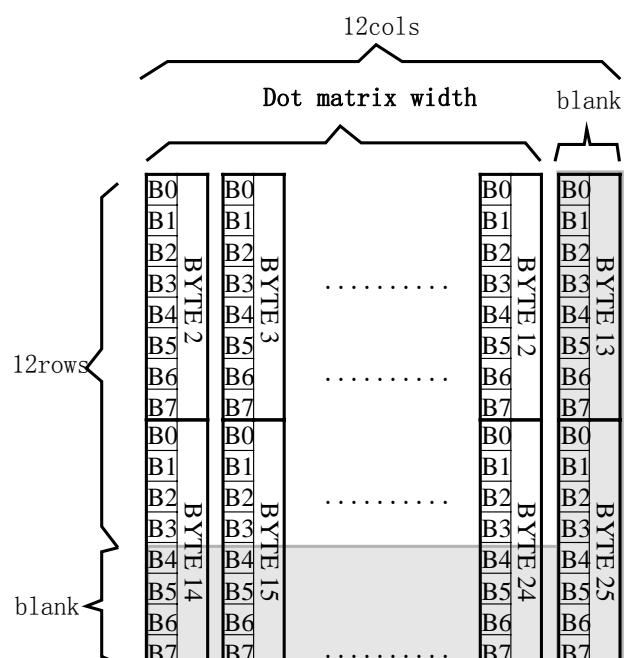

### 6.1.8 12 dots proportional arial font

12 dots proportional font has 26 bytes (BYTE 0 – BYTE25) data.

For the font is variant width, BYTE0~ BYTE1 are stored font width data,.BYTE2-25 are stored dots matrix data.

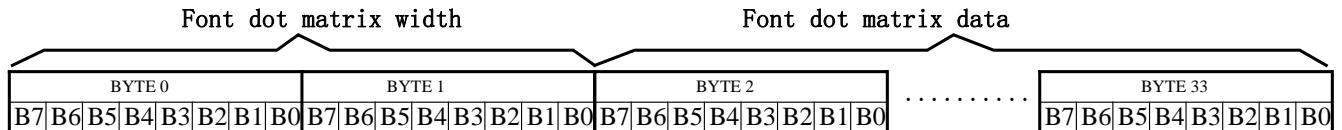

The dots matrix width of proportional font use BYTE as its unit. Different font width will reveal corresponding blanks. With the font's actual width data stored in BYTE0~BYTE 1, it can be used as reference for the position of the next word.

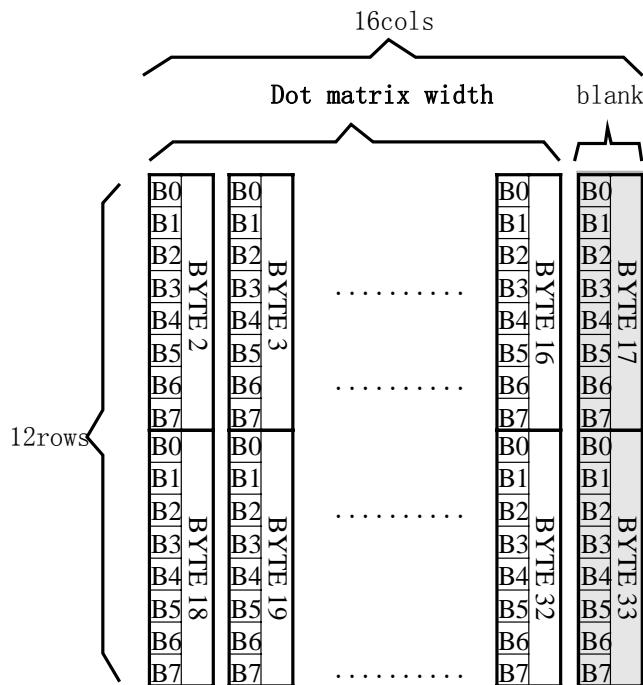

### 6.1.9 16 dots proportional arial font

16 dots proportional font has 34 bytes (BYTE 0 – BYTE33) data.

For the font is variant width, BYTE0~ BYTE1 are stored font width data,.BYTE2-33 are stored dots matrix data.

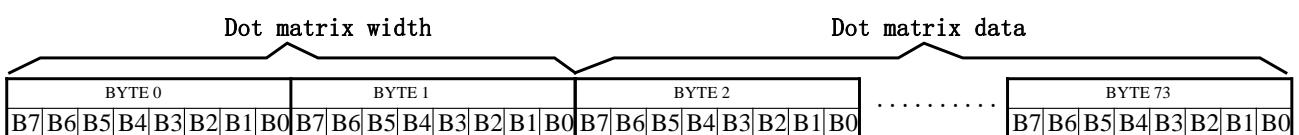

The dot matrix width of proportional font use BYTE as its unit. Different font width will reveal corresponding blanks. With the font's actual width data stored in BYTE0~BYTE 1, it can be used as reference for the position of the next word.

### 6.1.10 24 dots proportional font

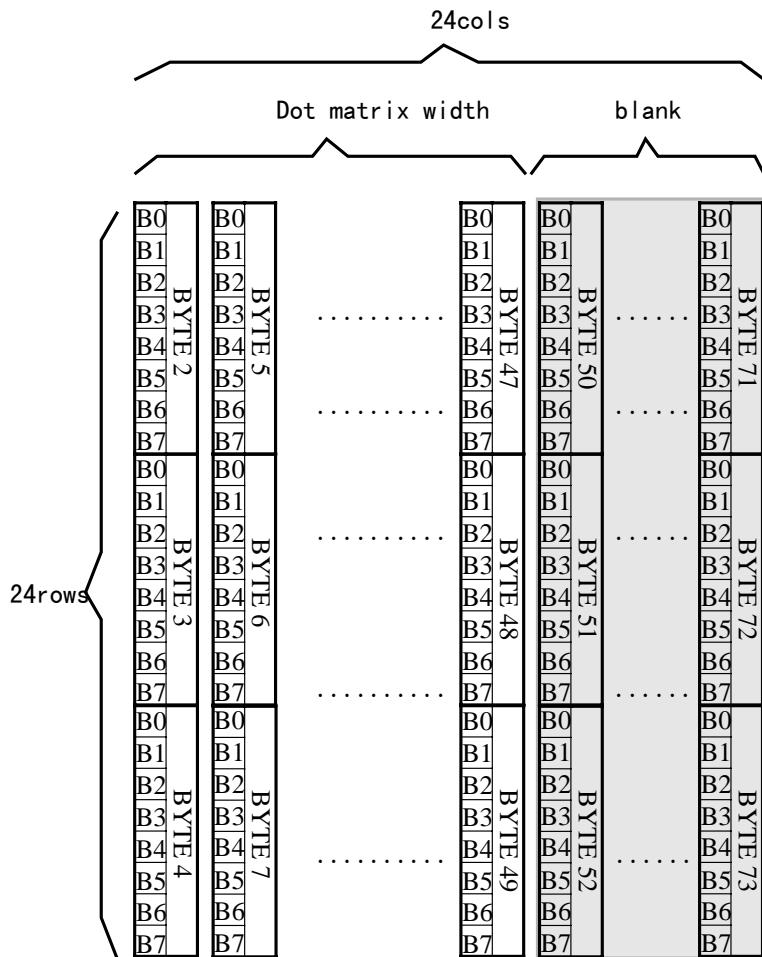

24 dots proportional font has 74 bytes (BYTE 0 – BYTE73) data.

For the font is variant width, BYTE0~ BYTE1 are stored font width data,.BYTE2-73 are stored dots matrix data.

The dot matrix width of proportional font use BYTE as its unit. Different font width will reveal

corresponding blanks. With the font's actual width data stored in BYTE0~BYTE 1, it can be used as reference for the position of the next word.

## 6.2 Dots font address table

	content	charset	Code scope	Characters	Address	Reference method
1	11X12 dots GB2312 font	GB2312	A1A1-F7FE	6763+846	00000	6.3.1.1
2	15X16 dots GB2312 font	GB2312	A1A1-F7FE	6763+846	5F4C0	6.3.1.2
3	24X24 dots GB2312 font	GB2312	A1A1-F7FE	6763+846	DE5C0	6.3.1.3

15	Input method code list				1ABA0C	
16	reserved				1FF6A4	

## 6.3 Calculation of character address

With certain calculation method, the user may obtain certain character dots address using character code.

### 6.3.1 Chinese font and Japanese font

#### 6.3.1.1 11X12 dots GB2312 font

##### Parameters:

GBCode: character code.

MSB: high byte of GBCode.

LSB: low byte of GBCode.

Address: address of character data in chip.

BaseAdd: the base address of the font in chip

##### Calculation of character address:

```

BaseAdd=0x0;
if(MSB >=0xA1 && MSB <= 0XA3 && LSB >=0xA1)
    Address =( (MSB - 0xA1) * 94 + (LSB - 0xA1))*24+ BaseAdd;
else if(MSB ==0xA6 && LSB >=0xA1)
    Address =( (MSB - 0xA1) * 94 + (LSB - 0xA1)-94*2 )*24+ BaseAdd;
else if(MSB ==0xA9 && LSB >=0xA1)
    Address =( (MSB - 0xA1) * 94 + (LSB - 0xA1)-94*4 )*24+ BaseAdd;
else if(MSB >= 0xa8 && MSB <= 0xa9 && LSB <= 0xa1)
{
    if(LSB>0x7f)LSB--;
}

```

```

Address = ((MSB-0xa8)*96 + (LSB-0x40)+94*5)*24+ BaseAdd;
}
else if(MSB >=0xB0 && MSB <= 0xF7 && LSB >=0xA1)
Address = ((MSB - 0xB0) * 94 + (LSB - 0xA1)+ 662)*24+ BaseAdd;

```

### 6.3.1.2 15X16 dots GB2312 font

**Parameters:**

GBCode: character code.

MSB: high byte of GBCode.

LSB: low byte of GBCode.

Address: address of character data in chip.

BaseAdd: the base address of the font in chip

**Calculation of character address:**

```

BaseAdd=0x5F4C0;
if(MSB >=0xA1 && MSB <= 0XA3 && LSB >=0xA1)
    Address =( (MSB - 0xA1) * 94 + (LSB - 0xA1))*32+ BaseAdd;
else if(MSB ==0xA6 && LSB >=0xA1)
    Address =( (MSB - 0xA1) * 94 + (LSB - 0xA1)-94*2 )*32+ BaseAdd;
else if(MSB ==0xA9 && LSB >=0xA1)
    Address =( (MSB - 0xA1) * 94 + (LSB - 0xA1)-94*4 )*32+ BaseAdd;
else if(MSB >= 0xa8 && MSB <= 0xa9 && LSB <= 0xa1)
{
    if(LSB>0x7f)LSB--;
    Address = ((MSB-0xa8)*96 + (LSB-0x40)+94*5)*32+ BaseAdd;
}
else if(MSB >=0xB0 && MSB <= 0xF7 && LSB >=0xA1)
    Address = ((MSB - 0xB0) * 94 + (LSB - 0xA1)+ 662)*32+ BaseAdd;

```

### 6.3.1.3 24X24 dots GB2312 font

**Parameters:**

GBCode: character code.

MSB: high byte of GBCode.

LSB: low byte of GBCode.

Address: address of character data in chip.

BaseAdd: the base address of the font in chip

**Calculation of character address:**

```

BaseAdd=0XDE5C0;
if(MSB >=0xA1 && MSB <= 0XA3 && LSB >=0xA1)
    Address =( (MSB - 0xA1) * 94 + (LSB - 0xA1))*72+ BaseAdd;
else if(MSB ==0xA6 && LSB >=0xA1)
    Address =( (MSB - 0xA1) * 94 + (LSB - 0xA1)-94*2 )*72+ BaseAdd;
else if(MSB ==0xA9 && LSB >=0xA1)
    Address =( (MSB - 0xA1) * 94 + (LSB - 0xA1)-94*4 )*72+ BaseAdd;
else if(MSB >= 0xa8 && MSB <= 0xa9 && LSB <= 0xa1)
{
    if(LSB>0x7f)LSB--;

```

```

Address = ((MSB-0xa8)*96 + (LSB-0x40)+94*5)*72+ BaseAdd;
}
else if(MSB >=0xB0 && MSB <= 0xF7 && LSB >=0xA1)
    Address = ((MSB - 0xB0) * 94 + (LSB - 0xA1)+ 662)*72+ BaseAdd;

```

### 6.3.1.4 11X12 dots GB12345 font

#### Parameters:

FontCode: character code.

MSB: high byte of FontCode.

LSB: low byte fo FontCode.

Address: address of character data in chip.

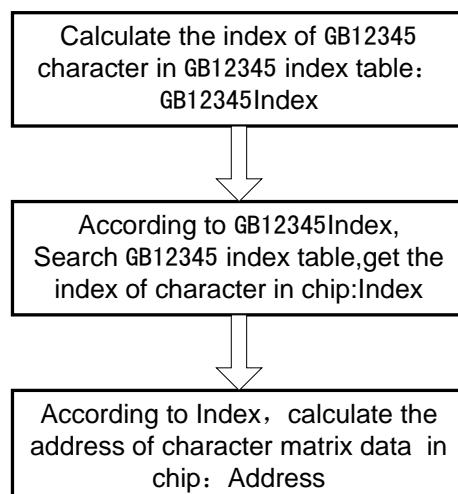

BaseAdd: the base address of the font in chip

GB12345Table: GB12345 index table. The table address is 0x190958

GB12345Index: index of the character in GB12345 index table.

Index: index of the character in font sets.

#### Calculation of character address:

```

BaseAdd=0x00;
if(MSB >=0xA1 && MSB <= 0XA3 && LSB >=0xA1)
    Address = ( (MSB - 0xA1) * 94 + (LSB - 0xA1))*24+ BaseAdd;
else if(MSB ==0xA6 && LSB >=0xA1)
    Address = ( (MSB - 0xA1) * 94 + (LSB - 0xA1)-94*2 )*24+ BaseAdd;
else if(MSB ==0xA9 && LSB >=0xA1)
    Address = ( (MSB - 0xA1) * 94 + (LSB - 0xA1)-94*4 )*24+ BaseAdd;
else if(MSB >=0xB0 && MSB <= 0XF9 && LSB >=0xA1)
{
    GB12345Index = (MSB - 0xB0) * 94 + (LSB - 0xA1);
    Index = GB12345Table [GB12345Index*2] * 256 + GB12345Table[GB12345Index*2+1];
    Address =Index * 24 + BaseAdd;
}

```

### 6.3.1.5 15X16 dots GB12345 font

#### Parameters:

FontCode: character code.

MSB: high byte of FontCode.

LSB: low byte of FontCode.

Address: address of character data in chip.

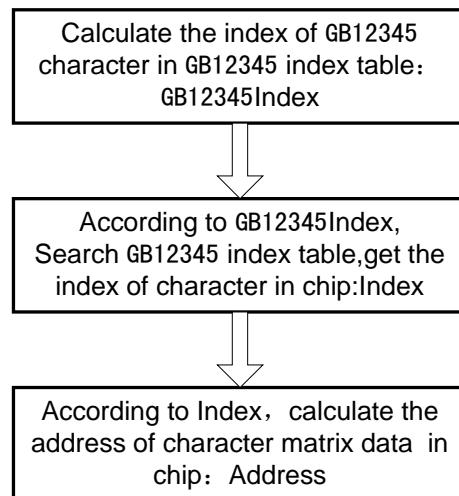

BaseAdd: the base address of the font in chip

GB12345Table: GB12345 index table. The table address is 0x190958

GB12345Index: index of the character in GB12345 index table.

Index: index of the character in font sets.

#### **Calculation of character address:**

BaseAdd=0x5F4C0;

```

if(MSB >=0xA1 && MSB <= 0XA3 && LSB >=0xA1)
    Address = (MSB - 0xA1) * 94 + (LSB - 0xA1)*32+ BaseAdd;
else if(MSB ==0xA6 && LSB >=0xA1)
    Address = (MSB - 0xA1) * 94 + (LSB - 0xA1)-94*2 )*32+ BaseAdd;
else if(MSB ==0xA9 && LSB >=0xA1)
    Address = (MSB - 0xA1) * 94 + (LSB - 0xA1)-94*4 )*32+ BaseAdd;
else if(MSB >=0xB0 && MSB <= 0XF9 && LSB >=0xA1)
{
    GB12345Index = (MSB - 0xB0) * 94 + (LSB - 0xA1);
    Index = GB12345Table [GB12345Index*2] * 256 + GB12345Table[GB12345Index*2+1];
    Address =Index * 32 + BaseAdd;
}
  
```

#### **6.3.1.6 24X24 dots GB12345 font**

##### **Parameters:**

FontCode: character code.

MSB: high byte of FontCode.

LSB: low byte of FontCode.

Address: address of character data in chip.

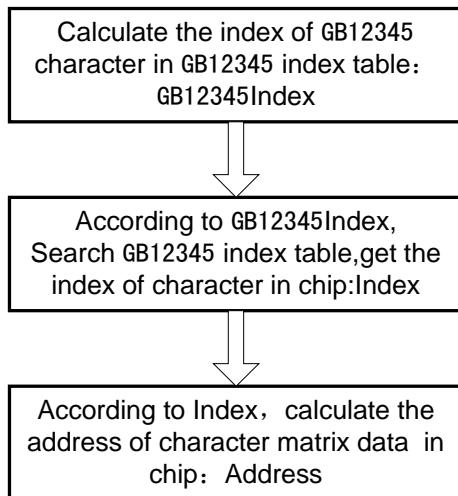

BaseAdd: the base address of the font in chip

GB12345Table: GB12345 index table. The table address is 0x190958

GB12345Index: index of the character in GB12345 index table.

Index: index of the character in font sets.

#### **Calculation of character address:**

```

BaseAdd=0XDE5C0;
if(MSB >=0xA1 && MSB <= 0XA3 && LSB >=0xA1)
    Address =((MSB - 0xA1) * 94 + (LSB - 0xA1))*72+ BaseAdd;
else if(MSB ==0xA6 && LSB >=0xA1)
    Address =((MSB - 0xA1) * 94 + (LSB - 0xA1)-94*2 )*72+ BaseAdd;
else if(MSB ==0xA9 && LSB >=0xA1)
    Address =((MSB - 0xA1) * 94 + (LSB - 0xA1)-94*4 )*72+ BaseAdd;
else if(MSB >=0xB0 && MSB <= 0XF9 && LSB >=0xA1)
{
    GB12345Index = (MSB - 0xB0) * 94 + (LSB - 0xA1);
    Index = GB12345Table [GB12345Index*2] * 256 + GB12345Table[GB12345Index*2+1];
    Address =Index * 72 + BaseAdd;
}
  
```

### 6.3.1.7 11X12 dots BIG5 font

#### Parameters:

FontCode: character code.

MSB: high byte of FontCode.

LSB: low byte fo FontCode.

Address: address of character data in chip.

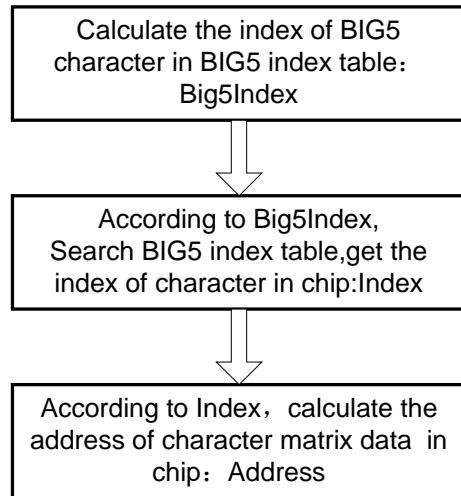

BaseAdd: the base address of the font in chip

Big5Table: BIG5index table. The table address is 0x193F06

Big5Index: index of the character in BIG5index table.

Index: index of the character in font sets.

#### Calculation of character address:

```
BaseAdd=0x00;  
if(MSB >=0xA1 && MSB <= 0XF9)  
{  
    if(LSB >=0x40 && LSB <= 0X7E)  
        Big5Index =(MSB - 0xA1) * 157 + (LSB - 0x40);  
    else if(LSB >=0XA1 && LSB <= 0XFE)  
        Big5Index =(MSB - 0xA1) * 157 + 63 + (LSB - 0XA1));  
}  
Index = Big5Table[Big5Index*2] * 256 + Big5Table[Big5Index*2+1];  
Address =Index * 24 + BaseAdd;
```

### 6.3.1.8 15X16 dots BIG5 font

#### Parameters:

FontCode: character code.

MSB: high byte of FontCode.

LSB: low byte fo FontCode.

Address: address of character data in chip.

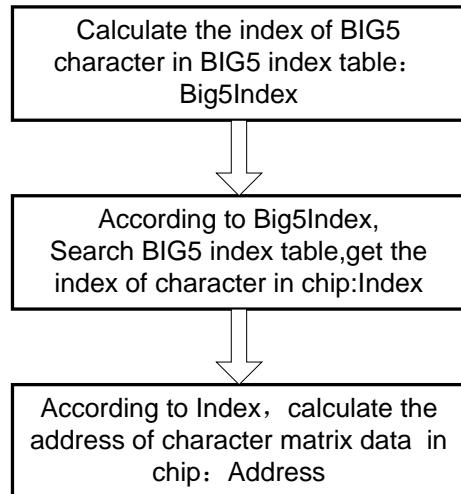

BaseAdd: the base address of the font in chip

Big5Table: BIG5index table. The table address is 0x193F06

Big5Index: index of the character in BIG5index table.

Index: index of the character in font sets.

#### Calculation of character address:

```

BaseAdd=0x5F4C0;
if(MSB >=0xA1 && MSB <= 0XF9)
{
    if(LSB >=0x40 && LSB <= 0X7E)
        Big5Index =(MSB - 0xA1) * 157 + (LSB - 0x40);
    else if(LSB >=0XA1 && LSB <= 0XFE)
        Big5Index =(MSB - 0xA1) * 157 + 63 + (LSB - 0XA1));
}
Index = Big5Table[Big5Index*2] * 256 + Big5Table[Big5Index*2+1];
Address =Index * 32 + BaseAdd;
  
```

### 6.3.1.9 24X24 dots BIG5 font

#### Parameters:

FontCode: character code.

MSB: high byte of FontCode.

LSB: low byte fo FontCode.

Address: address of character data in chip.

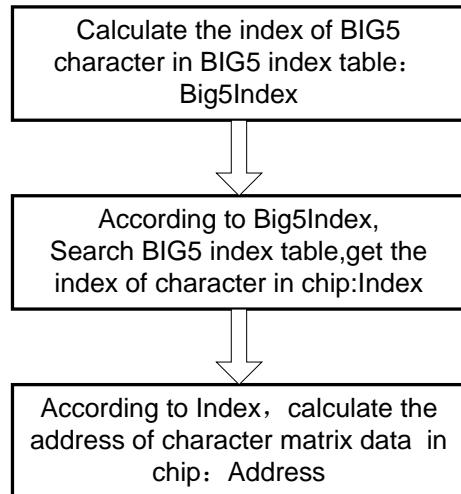

BaseAdd: the base address of the font in chip

Big5Table: BIG5index table. The table address is 0x193F06

Big5Index: index of the character in BIG5index table.

Index: index of the character in font sets.

#### Calculation of character address:

```

BaseAdd=0XDE5C0;
if(MSB >=0xA1 && MSB <= 0XC6)
{
    if(LSB >=0x40 && LSB <= 0X7E)
        Big5Index =(MSB - 0xA1) * 157 + (LSB - 0x40);
    else if(LSB >=0XA1 && LSB <= 0XFE)
        Big5Index =(MSB - 0xA1) * 157 + 63 + (LSB - 0XA1));
}
Index = Big5Table[Big5Index*2] * 256 + Big5Table[Big5Index*2+1];
If(Index<10139)
    Address =Index * 72 + BaseAdd;
  
```

### 6.3.1.10 11X12 dots Unicode font

#### Parameters:

FontCode: character code.

Address: address of character data in chip.

BaseAdd: the base address of the font in chip

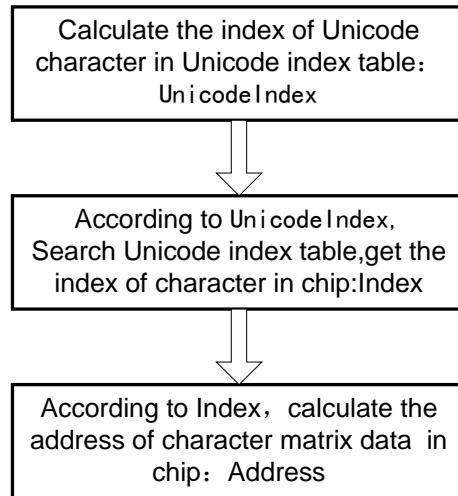

UnicodeTable: Unicode index table. The table address is 0x19AC30

UnicodeToIndex(): calculate index of the character in Unocode index table.

UnicodeIndex: index of the character in JIS index table.

Index: index of the character in font sets

#### Calculation of character address:

```

BaseAdd=0x00;
UnicodeIndex = UnicodeToIndex(FontCode);
Index = UnicodeTable [UnicodeIndex *2] * 256 + UnicodeTable [UnicodeIndex *2+1] ;
Address =Index * 24 + BaseAdd;
  
```

```

### 6.3.2 ASCII font

#### 6.3.2.1 5X7 5X7 dots ASCII font

**Parameters:**

ASCIICode: ASCII code(8 bits)  
BaseAdd: the base address of the font in chip  
Address: address of character data in chip.

**Calculation of character address:**

BaseAdd=0x1A73CC  
if (ASCIICode >= 0x20) and (ASCIICode <= 0x7E) then  
    Address = (ASCIICode -0x20 ) \* 8+BaseAdd

#### 6.3.2.2 7X8 dots ASCII font

**Parameters:**

ASCIICode: ASCII code(8 bits)  
BaseAdd: the base address of the font in chip  
Address: address of character data in chip.

**Calculation of character address:**

BaseAdd=0x1A76CC  
if (ASCIICode >= 0x20) and (ASCIICode <= 0x7E) then  
    Address = (ASCIICode -0x20 ) \* 8+BaseAdd

#### 6.3.2.3 6X12 dots ASCII font

**Parameters:**

ASCIICode: ASCII code(8 bits)  
BaseAdd: the base address of the font in chip  
Address: address of character data in chip.

**Calculation of character address:**

BaseAdd=0x1A79CC  
if (ASCIICode >= 0x20) and (ASCIICode <= 0x7E) then  
    Address = (ASCIICode -0x20 ) \* 12+BaseAdd

#### 6.3.2.4 8X16 dots ASCII font

**Parameters:**

ASCIICode: ASCII code(8 bits)  
BaseAdd: the base address of the font in chip  
Address: address of character data in chip.

**Calculation of character address:**

BaseAdd=0x1A7FCC  
if (ASCIICode >= 0x20) and (ASCIICode <= 0x7E) then  
    Address = (ASCIICode -0x20 ) \* 16+BaseAdd

#### 6.3.2.5 12 dots arial font

**Parameters:**

ASCIICode: ASCII code(8 bits)  
BaseAdd: the base address of the font in chip

Address: address of character data in chip.

**Calculation of character address:**

BaseAdd=0x1A87CC

if (ASCIICode >= 0x20) and (ASCIICode <= 0x7E) then

$$\text{Address} = (\text{ASCIICode} - 0x20) * 26 + \text{BaseAdd}$$

### 6.3.2.6 16 dots arial font

**Parameters:**

ASCIICode: ASCII code(8 bits)

BaseAdd: the base address of the font in chip

Address: address of character data in chip.

**Calculation of character address:**

BaseAdd=0x1A918C

if (ASCIICode >= 0x20) and (ASCIICode <= 0x7E) then

$$\text{Address} = (\text{ASCIICode} - 0x20) * 34 + \text{BaseAdd}$$

### 6.3.2.7 24 dots arial font

**Parameters:**

ASCIICode: ASCII code(8 bits)

BaseAdd: the base address of the font in chip

Address: address of character data in chip.

**Calculation of character address:**

BaseAdd=0x1A9E4C

if (ASCIICode >= 0x20) and (ASCIICode <= 0x7E) then

$$\text{Address} = (\text{ASCIICode} - 0x20) * 74 + \text{BaseAdd}$$
