1. General Description

HX8218-C01 is a 960 channel output source driver with TCON and DAC. The input interface can receive digital 8-bit serial/24-bit parallel RGB, or CCIR601/656 input signals and digital control timing signals. The DAC supports transferring digital RGB data to analog RGB data for the internal source driver. The TCON generates the 960x240 resolution timing to source driver and gate driver.

The source driver implements 2 groups of sample and hold circuits. While sampling video signals, the previously sampled data can be outputted synchronously through driver output channels. And simultaneous or sequential sampling can be chosen for matching the pixel array type.

The TCON provides horizontal and vertical control timing to source and gate drivers. With DAC and operational amplifiers, the gamma correction can be performed and digital data is converted to analog signal and then sent to source driver.

5.2 Relationship between gamma correction and output voltage

The 8 gamma correction reference voltages can be set externally or generated internally. If VSET=H, the gamma correction voltage is generated externally. If you want to set these voltages internally, set VSET=L and the default voltage is as below table based on VDD(5V) and VSS(0V). According to the different VDD and VSS, these 8 gamma correction reference voltages will be varied.

5.3 Digital RGB data input format

For digital RGB input data format, both SYNC mode and DE mode are supported. If DEN signal is fixed low, SYNC mode is used. Otherwise, DE mode is used. The zoom and OSD function is not supported in digital serial/parallel RGB mode.

5.4 NTSC/PAL mode auto detection

For NTSC/PAL mode setting, the auto-detection function is implemented. You don't have to define this setting and can use NPC pin to monitor detection result.

5.5 Input data sequence and color filter type

- I CF1 defines the input data sequence in serial digital RGB mode as following tables.

n CF1=L

Scan direction	UD	Low	Low	High	High
Shift direction	LRC	High	Low	High	Low
Data sequence	Odd line	RGB	BGR	BRG	GRB
	Even line	BRG	GRB	RGB	BGR

5.8 Power ON/OFF sequence

To prevent the device damage from latch up, the power ON/OFF sequence shown below must be followed.

Power ON: VCC, GND à VDD, VSS à V1 to V8

Power OFF: V1 to V8 à VDD, VSS à VCC, GND

5.9 Power ON Control

HX8218-C01 has a power ON sequence control function. There are two kinds of the mode. One is Auto mode, and another is Manual Mode.

Auto Mode: When power is ON, black data is outputted for 20-frames (default value) first, from the falling edge of the following Vsync signal.

It can be defined in Register R3 A_TIME1(bit5) and A_TIME0(bit4) when AUTO_DP(bit7) = "H"

Figure 5. 5 Power on control for Auto Mode

Manual Mode: When power is ON, you should set the Register R3 AUTO_DP(bit7) = "L" to stay at the manual mode. Black data is outputted until the DISP_ON(bit 6) = H then display the normal image.

Figure 5. 6 Power on control for Manual Mode

5.10 Standby ON/OFF Control

HX8218-C01 has a power ON/OFF sequence control function. When STB pin is pulled L, blank data is outputted for 5-frames first, from the falling edge of the following VSYNC signal. The blank data would be gray level 255 for normally white LC.
