HX8227-A01
720CH TFT LCD Source Driver
with Built-in TCON
Preliminary version 04, March 2006

1. General Description

HX8227-A is a 720-channel output source driver with built-in TCON (Timing Controller). The source driver receives 24-bit digital display data with single clock edge and generates corresponding 256 level gray scale voltage outputs to realize 16M colors display. Positive and negative polarity voltages can be alternately output from each channel in line (row) inversion or frame inversion driving methods.

2. Features

Source Driver

- 720 channels output source driver for TFT LCD panel
- Support 8-bit data input for 256 level gray scales
- Dynamic range: AVSS+0.2V ~ AVDD-0.2V
- Output voltage deviation: $\pm 20\text{mV}$.
- Driver power supply voltage (AVDD): 4.8 ~ 5.2V
- Bare chip with gold bumper for COG solution.

Embedded Timing Controller

- Support 480 RGBx272, 480RGBx240, 240RGBx320, and 240RGBx240 resolutions
- Supporting 24-bit (8 bits x 3) parallel RGB and 8-bit serial RGB input interfaces
- Operation frequency: 15 MHz max in parallel RGB interface. 33MHz max in serial RGB interface.
- Support PAL decimation in 480RGBx240 or 240RGBx240 resolutions.
- Selectable line (row) inversion and frame inversion driving schemes.
- Provide the control timing of the source driver and the gate driver.
- Logic power supply voltage (DVDD): 2.25V ~ 3.6V

Cautions

1. Please power on following the sequence DVDD → logic input → AVDD and V0 ~ V13. Reverse the sequence to shut down.
2. To stabilize the supply voltages, please be sure to insert a 0.1uF bypass capacitor between DVDD-DVSS and AVDD-AVSS. Furthermore, for increased precision of the D/A converter, insertion of a bypass capacitor of about 0.01uF is also advised between the gamma-corrected power supply terminals (V0, V1, ..., V13) and AVSS.

6. Function Description

6.1 Resolutions and Master / Slave Modes

HX8227-A has 4 different resolutions, set by RES1, RES2 pins as table 6.1. Since HX8227-A has 720 channels, two HX8227-A source drivers can be cascaded for extended 1440 channels of the 480RGB resolutions (RES2 = H).

RES2	RES1	Display Resolution
H	H	480RGB x 272
H	L	480RGB x 240
L	H	240RGB x 320
L	L	240RGB x 240

Table 6. 1 Resolution setting

For 480RGB resolutions, HX8227-A has 2 modes of timing control circuit, the Master mode or the Slave mode. And these modes are decided by Internal MS signal (IMS), IMS value is decided by RES2, MS, LR and TEST_IO2 pins as table 6.2. When HX8227-A is set as Master mode, it latches the display data from the 1st clock at DE active regions. Otherwise, HX8227-A starts latching data from either the 241st clock in parallel interface (PS="H"), or from the 721st clock in serial interface (PS="L"). On the contrary, when HX8227-A is set in 240RGB resolutions (RES2="L"), it is always considered as the master, and starts latching data from the 1st clock at DE active region.

RES2	MS	LR	TEST_IO2	IMS(Internal MS signal)
L	X	X	X	Master mode
H	L	X	L	Slave mode
H	H	X	L	Master mode
H	L	H	H	Slave mode
H	H	H	H	Master mode
H	L	L	H	Master mode
H	H	L	H	Slave mode

6.2 Parallel / Serial Mode and LR function

HX8227-A has 2 modes for input interface, parallel and serial interface. In parallel interface (PS="H"), 24-bit data are transferred into HX8227-A each cycle when DE is activated. Meanwhile, if LR="H" (right shift), D07 to D00 is displayed for output channel S_{3n-2} , D17 to D10 are displayed for channel S_{3n-1} , and D27 to D20 are displayed for channel S_{3n} , where $n=1, 2, \dots$ to 240 sequentially. The relationship between display data and source output is shown in the following figure.

If LR="L" (left shift), D07 to D00, D17 to D10, and D27 to D20 are still displayed for channel S_{3n-2} , S_{3n-1} , and S_{3n} , respectively, but $n=240, 239, \dots$ to 1 sequentially.

Input data format: 24-bit RGB, 3 dots (sub-pixels) per clock

Input data width: 24 bits with Dx7 is MSB and Dx0 is LSB, $x = 1 \sim 3$

LR	First			Last

6.3 Source Driver Function

HX8227-A incorporates 8-bit D/A Converters to transfer input digital data into output analog voltage for each channel. The D/A converters are consists of ladder resistors and switches. The ladder resistors (R0 to R254) are designed so that the ratio of LCD panel gamma-compensated voltages V_{0p} to V_{255p} for positive and V_{0n} to V_{255n} for negative polarity. There are two sets of 7 gamma-compensated power supplies, which are V0 to V6, V7 to V13.

Figure 6. 3 shows relationship between the internal gamma-compensation circuit and the converted analog voltages for both polarities. Gamma-compensation circuit is consisted of gamma-ladder resistors and polarity select switches. The polarity select switches change the connection of gamma-resistor and D/A converter according to the timing of driving polarity.

The converted analog voltages VR, VG, and VB are then sampled, and held by the 720-channel driver, then output through unit gain buffers. The relationship between the source driver output and the input data are shown in Figure 6. 4.

For the gamma-correction reference voltages V0 to V13, AVDD, and AVSS, be sure to maintain the voltage relationships of the following power supplies:

$$\begin{aligned} \text{AVDD} - 0.2\text{V} & \quad V0 > V1 > V2 > V3 > \dots > V6 & \quad \text{AVSS} + 0.2 \text{ V.} \\ \text{AVDD} - 0.2\text{V} & \quad V7 > V8 > V9 > V10 > \dots > V13 & \quad \text{AVSS} + 0.2 \text{ V.} \end{aligned}$$

Table 6. 3 and Table 6. 4 show the relationship between the input data and the output voltage. The resistance value of the resistor strings is also listed.

6.4 Gate Driver Timing Control

HX8227-A incorporates a timing controller to generate signals for the gate driver IC. HX8227-A outputs gate driver timing signals from CKV, STV, and OEV pins.

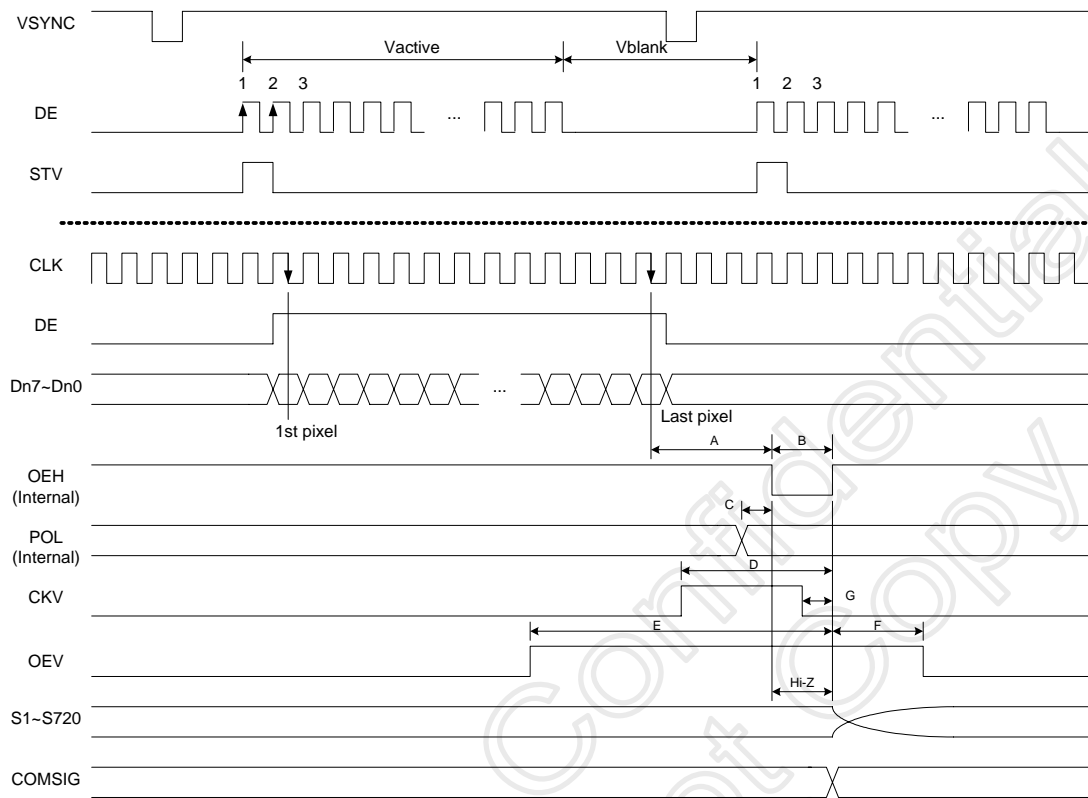

Figure 6. 5 Gate driver timing control

Timing	480RGBx272	480RGBx240	240RGBx320	240RGBx240
A	8	8	4	4
B	4	4	2	2
C	0	0	0	0
D	10	10	5	5
E	34	34	17	17
F	6	6	3	3
G	2	2	1	1

Table 6. 3 Relationship between resolution and output timing

Note: The above parameters are for 24-bit parallel RGB interface. For 8-bit serial RGB interface, the parameters are all tripled.

6.5 Power ON/OFF Control

HX8227-A has a power ON/OFF sequence control function. When DISP pin is pulled “H”, blank data is outputted for 10-frames first, from the falling edge of the following VSYNC signal. Similarly, when DISP is pulled “L”, 10-frames of blank data will be outputted from the falling edge of the following VSYNC, too. The blank data would be gray level 0 for normally black LC (NBW=“H”), and be gray level 255 for normally white LC (NBW=“L”).

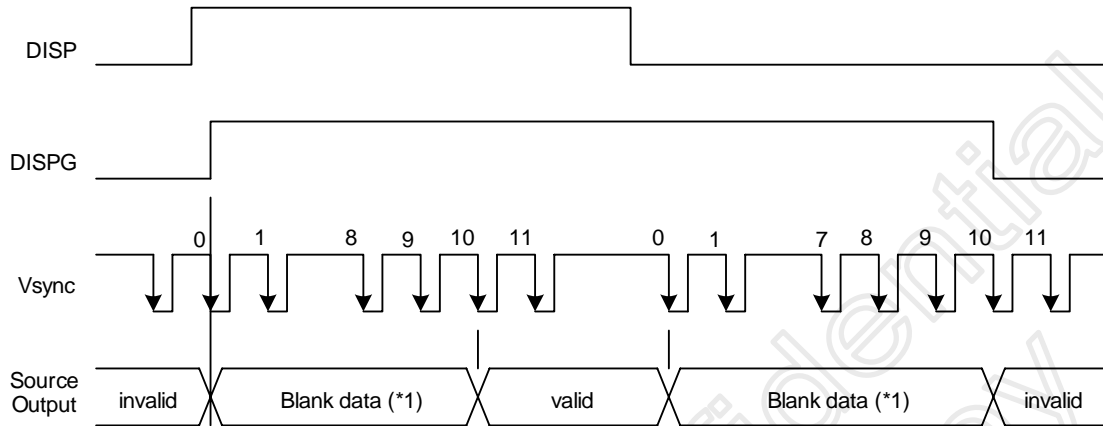

Figure 6. 6 Power on/off control

6.6 Reset

HX8227-A is internally initialized by the global reset signal, RESETB. The reset input must be held for at least 1ms after power is stable.
