## INTRODUCTION

The S6B0796 is a 240-outputs segment/common driver LSI for graphic dot-matrix liquid crystal display systems. It is fabricated by low power CMOS high voltage process technology. This device consists of 240-bits bi-directional shift register, 240-bits data latch and 240-bits driver. In case of segment mode, the data input is selected 4bit parallel input mode and 8bit parallel input mode by a mode (MD) pin. In case of common mode, data input/output pins are bi-directional, four data shift directions are pin-selectable.

## FEATURES

### Both Segment Mode and Common Mode

- Supply voltage for LC driver: +15.0 to +32.0V
- Number of LC driver outputs: 240
- Low output impedance
- Low power consumption
- Supply voltage for the logic system: +2.4V to +5.5V
- CMOS silicon gate process (P-type Silicon Substrate)
- Package: 268-pin TCP (Tape Carrier Package) or Gold bumped chip

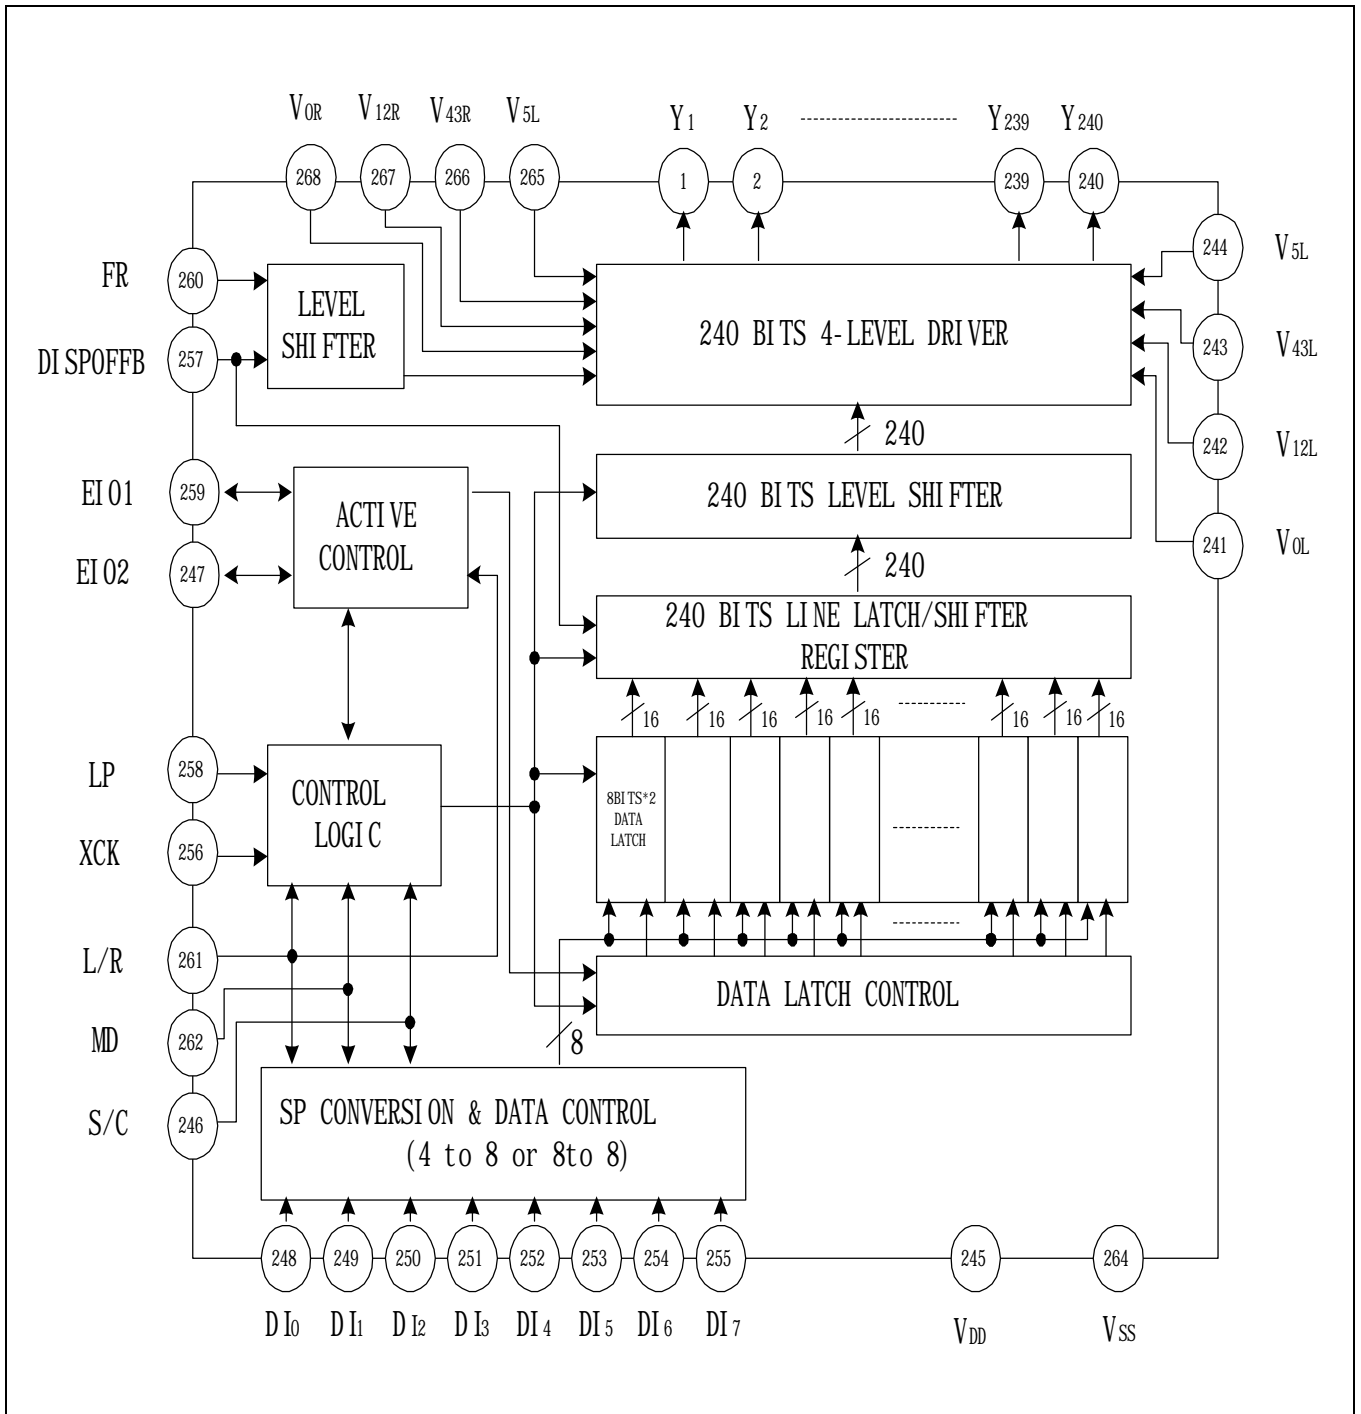

### Segment Mode

- Shift clock frequency: 20MHz (Max) ( $V_{dd}=+5V\pm 10\%$ )  
12MHz (Max) ( $V_{dd}=+2.4V$  to  $+4.5V$ )
- Adopts a data bus system
- 4- / 8-bit parallel input modes are selectable with a mode (MD) pin
- Automatic transfer function of an enable signal
- Automatic counting function which, in the chip select, causes the internal clock to be stopped by automatically counting 240 of input data
- Line latch circuit reset function when DISPOFFB active

### Common Mode

- Shift clock frequency: 4.0MHz (Max) ( $v_{dd}=+2.4V$  to  $+5.5V$ )
- Built-in 240-bits bi-directional shift register (divisible into 120-bits  $\times 2$ )
- Available in a single mode (240-bits shift register)  
or in a dual mode (120-bits shift register  $\times 2$ )
- Shift register circuit reset function when DISPOFFB active

### PAD CONFIGURATION

Figure 2. S6B0796 Chip Configuration

Table 1. S6B0796 Pad Dimensions

Item	Pad NO.	Size		Unit
		X	Y	
Chip size	-	16200	1100	mm
Pad pitch	1 to 240	65 (Min.)		
	241 to 292	260 (Min.)		
Bumped pad size	1 to 240	43	108	
	241 to 244 289 to 292	76	73	
	245 to 288	58	76	
Bumped pad height	1 to 292	14 (Typ.)		

## PAD CENTER COORDINATES

Table 2. Pad Center Coordinates

## PIN DESCRIPTION

Pin No.	Symbol	I/O	Description
1 to 240	Y1 – Y240	O	LC driver output
241, 292	V <sub>0L</sub> , V <sub>0R</sub>	-	Power supply for LC driver
242, 291	V <sub>12L</sub> , V <sub>12R</sub>	-	Power supply for LC driver
243, 290	V <sub>43L</sub> , V <sub>43R</sub>	-	Power supply for LC driver
244, 289	V <sub>5L</sub> , V <sub>5R</sub>	-	Power supply for LC driver
272	L/R	I	Display data shift direction selection
252 to 256	V <sub>DD</sub>	-	Power supply for logic system(+2.4 to +5.5V)
257	S/C	I	Segment mode/common mode selection
258	EIO <sub>2</sub>	I/O	Input/output for chip select or data of shift register
259 to 265	DI <sub>0</sub> – DI <sub>6</sub>	I	Display data input for segment mode
266	DI <sub>7</sub>	I	Display data input for segment mode/Dual mode data input
267	XCK	I	Display data shift clock input for segment mode
268	DISPOFFB	I	Control input for deselect output level
269	LP	I	Latch pulse input/shift clock input for shift register
270	EIO <sub>1</sub>	I/O	Input/output for chip select or data of shift register
271	FR	I	AC-converting signal input for LC driver waveform
273	MD	I	Mode selection input
275 to 280	V <sub>SS</sub>	-	Ground(0V)

Table 3 Pin Description

## FUNCTIONAL DESCRIPTION

### BLOCK FUNCTION

#### . Active Control

In case of segment mode, controls the selection or deselection of the chip. Following a LP signal, and after the chip select signal is input, a select signal is generated internally until 240 bits of data have been read in. Once data input has been completed, a select signal for cascade connection is output, and the chip is deselected. In case of common mode, controls the input/output data of bidirectional pins.

#### . SP Conversion & Data Control

In case of segment mode, keep input data which are 2 clocks of XCK at 4-bit parallel mode into latch circuit, or keep input data which are 1 clock of XCK at 8-bits parallel mode into latch circuit, after that they are put on the internal data bus 8 bits at a time.

#### . Data Latch Control

In case of segment mode, selects the state of the data latch which reads in the data bus signals. The shift direction is controlled by the control logic, for every 16 bits of data read in, the selection signal shifts one bit based on the state of the control circuit.

#### . Data Latch

In case of segment mode, latches the data on the data bus. The latched state of each LC driver output pin is controlled by the control logic and the data latch control, 240 bits of data are read in 30 sets of 8 bits.

#### . Line Latch / Shift Register

In case of segment mode, all 240 bits which have been read into the data latch are simultaneously latched on the falling edge of the LP signal, and output to the level shifter block. In case of common mode, shifts data from the data input pin on the falling edge of the LP signal.

#### . Level Shifter

The logic voltage signal is level-shifted to the LC driver voltage level, and output to the driver block.

#### . 4-level Driver

Driver the LC driver output pins from the line latch/shift register data, selecting one of 4 levels ( $V_0$ ,  $V_{12}$ ,  $V_{43}$ ,  $V_5$ ) based on the S/C, FR and DISPOFFB signals.

#### . Control logic

Controls the operation of each block. In case of segment mode, when a LP signal has been input, all blocks are reset and the control logic waits for the selection signal output from the active control block. Once the selection signal has been output, operation of the data latch and data transmission are controlled, 240 bits of data are read in, and the chip is deselected. In case of common mode, controls the direction of data shift.

## PIN FUNCTION

### Segment mode

Symbol	Function
<b>V<sub>DD</sub></b>	Logic system power supply pin connects to +2.4 to +5.5V
<b>V<sub>SS</sub></b>	Ground pin connects to 0 V
<b>V<sub>0R</sub>, V<sub>0L</sub> V<sub>12R</sub>, V<sub>12L</sub> V<sub>43R</sub>, V<sub>43L</sub> V<sub>5R</sub>, V<sub>5L</sub></b>	Power supply pin for LC driver voltage bias. <ul style="list-style-type: none"> <li>. Normally, the bias voltage used is set by a resistor divider.</li> <li>. Ensure that voltage are set such that <math>V_{SS} \leq V_5 &lt; V_{43} &lt; V_{12} &lt; V_0</math>.</li> <li>. To further reduce the difference between the output waveforms of LC driver output pins Y<sub>1</sub> and Y<sub>160</sub>, externally connect V<sub>iR</sub> and V<sub>iL</sub> (I = 0, 12, 43, 5)</li> </ul>
<b>DI<sub>0</sub> – DI<sub>7</sub></b>	Input pin for display data <ul style="list-style-type: none"> <li>. In 4-bit parallel input mode, input data into the 4 pins DI<sub>0</sub> – DI<sub>3</sub>. Connect DI<sub>4</sub> – DI<sub>7</sub> to V<sub>SS</sub> or V<sub>DD</sub>.</li> <li>. In 8-bit parallel input mode, input data into the 8 pins DI<sub>0</sub> – DI<sub>7</sub>.</li> </ul>
<b>XCK</b>	Clock input pin for taking display data <ul style="list-style-type: none"> <li>. Data is read on the falling edge of the clock pulse.</li> </ul>
<b>LP</b>	Latch pulse input pin for display data <ul style="list-style-type: none"> <li>. Data is latched on the falling edge of the clock pulse.</li> </ul>
<b>L/R</b>	Direction selection pin for reading display data <ul style="list-style-type: none"> <li>. When set to V<sub>SS</sub> level “L”, data is read sequentially from Y<sub>240</sub> to Y<sub>1</sub>.</li> <li>. When set to V<sub>DD</sub> level “H”, data is read sequentially from Y<sub>1</sub> to Y<sub>240</sub>.</li> </ul>
<b>DISPOFFB</b>	Control input pin for output deselect level <ul style="list-style-type: none"> <li>. The input signal is level-shifted from logic voltage level to LC drive voltage level, and controls LC drive circuit.</li> <li>. When set to V<sub>SS</sub> level “L”, the LC drive output pins (Y<sub>1</sub> - Y<sub>240</sub>) are set to level V<sub>5</sub>.</li> <li>. While set to “L”, the contents of the line latch are reset, but read the display data in the data latch regardless of condition of DISPOFFB.</li> <li>. When the DISPOFFB function is canceled, the driver outputs deselect level (V<sub>12</sub> or V<sub>43</sub>), then outputs the contents of the data latch on the next.</li> <li>. Falling edge of the LP. That time, if DISPOFFB removal time can not keep regulation what is shown AC characteristics (page 21), can not output the reading data correctly.</li> </ul>

<b>FR</b>	<p>AC signal input for LC driving waveform</p> <ul style="list-style-type: none"> <li>. The input signal is level-shifted from logic voltage level to LC drive voltage level, and controls LC drive circuit.</li> <li>. Normally, inputs a frame inversion signal.</li> <li>. The LC driver output pin's output voltage level can be set using the line latch output signal and the FR signal.</li> </ul> <p>Table of truth values is shown in table 4.</p>
<b>MD</b>	<p>Mode selection pin</p> <ul style="list-style-type: none"> <li>. When set to <math>V_{SS}</math> level "L", 8-bit parallel input mode is set.</li> <li>. When set to <math>V_{DD}</math> level "H", 4-bit parallel input mode is set.</li> <li>. The relationship between the display data and driver output pins is shown in table 5.</li> </ul>
<b>S/C</b>	<p>Segment mode/common mode selection pin</p> <ul style="list-style-type: none"> <li>. When set to <math>V_{DD}</math> level 'H', segment mode is set.</li> </ul>
<b>EIO<sub>1</sub></b> <b>EIO<sub>2</sub></b>	<p>Input / output pin for chip selection</p> <ul style="list-style-type: none"> <li>. When L/R input is at <math>V_{SS}</math> level 'L', EIO<sub>1</sub> is set for output, and EIO<sub>2</sub> is set for input.</li> <li>. When L/R input is at <math>V_{DD}</math> level 'H', EIO<sub>1</sub> is set for input, and EIO<sub>2</sub> is set for output.</li> <li>. During output. set to "H" while LP*XCLKB is 'H' and after 240-bits of data have been read, set to "L" for one cycle (from falling edge to falling edge of XCK), after which it returns to "H".</li> <li>. During input, after the LP signal is input, the chip is selected while EI is set to "L". After 240-bits of data have been read, the chip is deselected.</li> </ul>
<b>Y<sub>1</sub> – Y<sub>240</sub></b>	<p>LC driver output pins</p> <ul style="list-style-type: none"> <li>. Corresponding directly to each bit of the data latch, one level(<math>V_0</math>, <math>V_{12}</math>, <math>V_{43}</math>, or <math>V_5</math>) is selected and output.</li> </ul> <p>Table of truth values is shown in table 4.</p>

## Common Mode

Symbol	Function
$V_{DD}$	Logic system power supply pin connects to +2.4 to +5.5V
$V_{SS}$	Ground pin connects to 0 V
$V_{0R}, V_{0L}$ $V_{12R}, V_{12L}$ $V_{43R}, V_{43L}$ $V_{5R}, V_{5L}$	Power supply pin for LC driver voltage bias. . Normally, the bias voltage used is set by a resistor divider. . Ensure that voltage are set such that $V_{SS} < V_{43} < V_{12} < V_0$ . . To further reduce the difference between the output waveforms of LC driver output pins $Y_1$ and $Y_{240}$ , externally connect $V_{iR}$ and $V_{iL}$ ( $i=0, 12, 43, 5$ )
$EIO_1$	Bidirectional shift register shift data input/output pin . Output pin when L/R is at $V_{SS}$ level "L", input pin when L/R is at $V_{DD}$ level "H". . When $EIO_1$ is used as input pin, it will be pull-down. . When $EIO_1$ is used as output pin, it won't be pull-down.
$EIO_2$	Bidirectional shift register shift data input/output pin . Input pin when L/R is at $V_{SS}$ level "L", output pin when L/R is at $V_{DD}$ level "H". . When $EIO_2$ is used as input pin, it will be pull-down. . When $EIO_2$ is used as output pin, it won't be pull-down.
$LP$	Bidirectional shift register shift clock pulse input pin . Data is shifted on the falling edge of the clock pulse.
$L/R$	Bidirectional shift register shift direction selection pin . Data is shifted from $Y_{240}$ to $Y_1$ when set to $V_{SS}$ to level "L", and data is shifted from $Y_1$ to $Y_{240}$ when set to $V_{DD}$ level "H".

<b>DISPOFFB</b>	<p>Control input pin for output deselect level</p> <ul style="list-style-type: none"> <li>. The input signal is level-shifted from logic voltage level to LC drive voltage level, and controls LC drive circuit.</li> <li>. When set to <math>V_{SS}</math> level "L", the LC drive output pins(<math>Y_1</math>-<math>Y_{240}</math>) are set to level <math>V_5</math>.</li> <li>. While set to "L", the contents of the shift register are reset not reading data. When the DISPOFFB function is canceled, the driver outputs deselect Level(<math>V_{12}</math> or <math>V_{43}</math>), and the shift data is reading on the falling edge of the LP. That time, if DISPOFFB removal time can not keep regulation what is shown AC characteristics (page 26), the shift data is not reading correctly.</li> </ul>
<b>FR</b>	<p>AC signal input for LC driving waveform</p> <ul style="list-style-type: none"> <li>. The input signal is level-shifted from logic voltage level to LC drive voltage level, and controls LC drive circuit.</li> <li>. Normally, input a frame inversion signal.</li> <li>. The LC driver output pin's output voltage level can be set using the shift register output signal and the FR signal. Table of truth values is shown in table 4.</li> </ul>
<b>MD</b>	<p>Mode selection pin</p> <ul style="list-style-type: none"> <li>. When set to <math>V_{SS}</math> level "L", Single mode operation is selected, when set to <math>V_{DD}</math> level "H", Dual mode operation is selected.</li> </ul>
<b>DI<sub>7</sub></b>	<p>Dual Mode data input pin</p> <ul style="list-style-type: none"> <li>. According to the data shift direction of the data shift register, data can be input starting from the 121<sup>st</sup> bit.</li> <li>. When the chip is used as Dual mode, DI<sub>7</sub> will be pull-down.</li> <li>. When the chip is used as Single mode, DI<sub>7</sub> won't be pull-down.</li> </ul>
<b>S/C</b>	<p>Segment mode/common mode selection pin</p> <ul style="list-style-type: none"> <li>. When set to <math>V_{SS}</math> level "L", common mode is set.</li> </ul>
<b>DI<sub>0</sub> – DI<sub>6</sub></b>	<p>Not used</p> <ul style="list-style-type: none"> <li>. Connect DI<sub>0</sub> – DI<sub>6</sub> to <math>V_{SS}</math> or <math>V_{DD}</math>. Avoiding floating.</li> </ul>
<b>XCK</b>	<p>Not used</p> <ul style="list-style-type: none"> <li>. XCK is pull-down in common mode, so connect to <math>V_{SS}</math> or open.</li> </ul>
<b>Y<sub>1</sub> – Y<sub>240</sub></b>	<p>LC driver output pins</p> <ul style="list-style-type: none"> <li>. Corresponding directly to each bit of the shift register, one level(<math>V_0</math>, <math>V_{12}</math>, <math>V_{43}</math>, or <math>V_5</math>) is selected and output. Table of truth values is shown in table 4.</li> </ul>

## FUNCTIONAL OPERATIONS

### TRUTH TABLE (Table 4)

#### Segment Mode

FR	Latch data	DISPOFFB	Driver output voltage level (Y <sub>1</sub> – Y <sub>240</sub> )
L	L	H	V <sub>43</sub>
L	H	H	V <sub>5</sub>
H	L	H	V <sub>12</sub>
H	H	H	V <sub>0</sub>
x	x	L	V <sub>5</sub>

Here,  $V_{SS} \leq V_5 < V_{43} < V_{12} < V_0$ , H : V<sub>DD</sub> (+2.4V to +5.5V), L : V<sub>SS</sub>(0V), x : Don't care

#### Common Mode

FR	Latch data	DISPOFFB	Driver output voltage level (Y <sub>1</sub> – Y <sub>240</sub> )
L	L	H	V <sub>43</sub>
L	H	H	V <sub>0</sub>
H	L	H	V <sub>12</sub>
H	H	H	V <sub>5</sub>
x	x	L	V <sub>5</sub>

Here,  $V_{SS} \leq V_5 < V_{43} < V_{12} < V_0$ , H : V<sub>DD</sub> (+2.4V to +5.5V), L : V<sub>SS</sub>(0V), x : Don't care

NOTE : There are two kinds of power supply (logic level voltage, LC drive voltage) for LCD driver, please supply regular voltage which assigned by specification for each power pin. That time 'Don't care' should be fixed to 'H' or 'L', avoiding floating.

## RELATIONSHIP BETWEEN THE DISPLAY DATA AND DRIVER OUTPUT PINS (Table 5)

### Segment Mode

#### (a) 4-bit Parallel Mode

MD	L/R	EIO1	EIO2	Data Input	Figure of clock

Table 5 (Continued)

## Common Mode

MD	L/R	Data transfer direction	EIO1	EIO2	DI7
<b>L</b> <b>(Single)</b>	L(shift to left)	$Y_{240} \rightarrow Y_1$	Output	Input	X
	H(shift to right)	$Y_1 \rightarrow Y_{240}$	Input	Output	X
<b>H</b> <b>(Dual)</b>	L(shift to left)	$Y_{240} \rightarrow Y_{121}$	Output	Input	Input
		$Y_{120} \rightarrow Y_1$			
	H(shift to right)	$Y_1 \rightarrow Y_{120}$ $Y_{121} \rightarrow Y_{240}$	Input	Output	Input

Here, L : Vss(0V), H : VDD(+2.4V to +5.5V), X : Don't care

NOTE: "Don't care" should be fixed to "H" or "L", avoid floating.

## SPECIFICATIONS

### ABSOLUTE MAXIMUM RATINGS

Table 6. Absolute Maximum Ratings

Parameter	Symbol	Conditions	Applicable pins	Ratings	Unit
Supply voltage (1)	V <sub>DD</sub>	T <sub>a</sub> =25 °C Referenced to V <sub>SS</sub> (0V)	V <sub>DD</sub>	-0.3 to +6.5	V
Supply voltage (2)	V <sub>0</sub>		V <sub>0L</sub> , V <sub>0R</sub>	-0.3 to +35	V
	V <sub>12</sub>		V <sub>12L</sub> , V <sub>12R</sub>	-0.3 to V <sub>0</sub> +0.3	V
	V <sub>43</sub>		V <sub>43L</sub> , V <sub>43R</sub>	-0.3 to V <sub>0</sub> +0.3	V
	V <sub>5</sub>		V <sub>5L</sub> , V <sub>5R</sub>	-0.3 to V <sub>0</sub> +0.3	V
Input voltage	V <sub>1</sub>		DI <sub>0</sub> –DI <sub>7</sub> , XCK, LP, L/R, MD, S/C, EIO <sub>1</sub> , EIO <sub>2</sub> , DISPOFFB	-0.3 to V <sub>DD</sub> +0.3	V
Storage temperature	T <sub>STG</sub>			-45 to 125	°C

### RECOMMENDED OPERATING CONDITIONS

Table 7. Recommended Operating Conditions

Parameter	Symbol	Conditions	Applicable pins	Min.	Typ.	Max.	Unit
Supply voltage (1)	V <sub>DD</sub>	Referenced to V <sub>SS</sub> (0V)	V <sub>DD</sub>	+2.4		+5.5	V
Supply voltage (2)	V <sub>0</sub>		V <sub>0L</sub> , V <sub>0R</sub>	+15		+32	V
Operating temperature	T <sub>OPR</sub>			-20		+85	°C

NOTE: Ensure that voltage are set such that  $V_{SS} \leq V_5 < V_{43} < V_{12} < V_0$

## DC CHARACTERISTICS

## DC CHARACTERISTICS(Table 8)

## Segment Mode

(VSS=V5=0V, VDD=+2.4 to 5.5V, V0=+15 to +32V, Ta=-20~85°C)

Parameter	Symbol	Conditions	Applicable pins	Min.	Typ.	Max.	Unit
Input voltage	V <sub>IH</sub>		DI <sub>0</sub> -DI <sub>7</sub> , XCK, LP, L/R, FR, MD, S/C,EIO <sub>1</sub> , EIO <sub>2</sub> , DISPOFFB	0.8V <sub>DD</sub>			V
	V <sub>IL</sub>					0.2V <sub>DD</sub>	V
Output voltage	V <sub>OH</sub>	I <sub>OH</sub> =-0.4mA	EIO <sub>1</sub> , EIO <sub>2</sub>	V <sub>DD</sub> -0.4			V

DISPOFFB "L" pulse width	TWDL		1.2			us
Output delay time (1)	T <sub>D</sub>	C <sub>L</sub> =15pF			57	ns
Output delay time (2)	T <sub>PD1</sub> , T <sub>PD2</sub>	C <sub>L</sub> =15pF			1.2	us
Output delay time (3)	T <sub>PD3</sub>	C <sub>L</sub> =15pF			1.2	us

NOTES: \*1 Take the cascade connection into consideration.

\*2 (TWCK - TWCKH - TWCKL) / 2 is maximum in the case of high speed operation.

Timing Characteristics of Segment Mode (Figure 3)

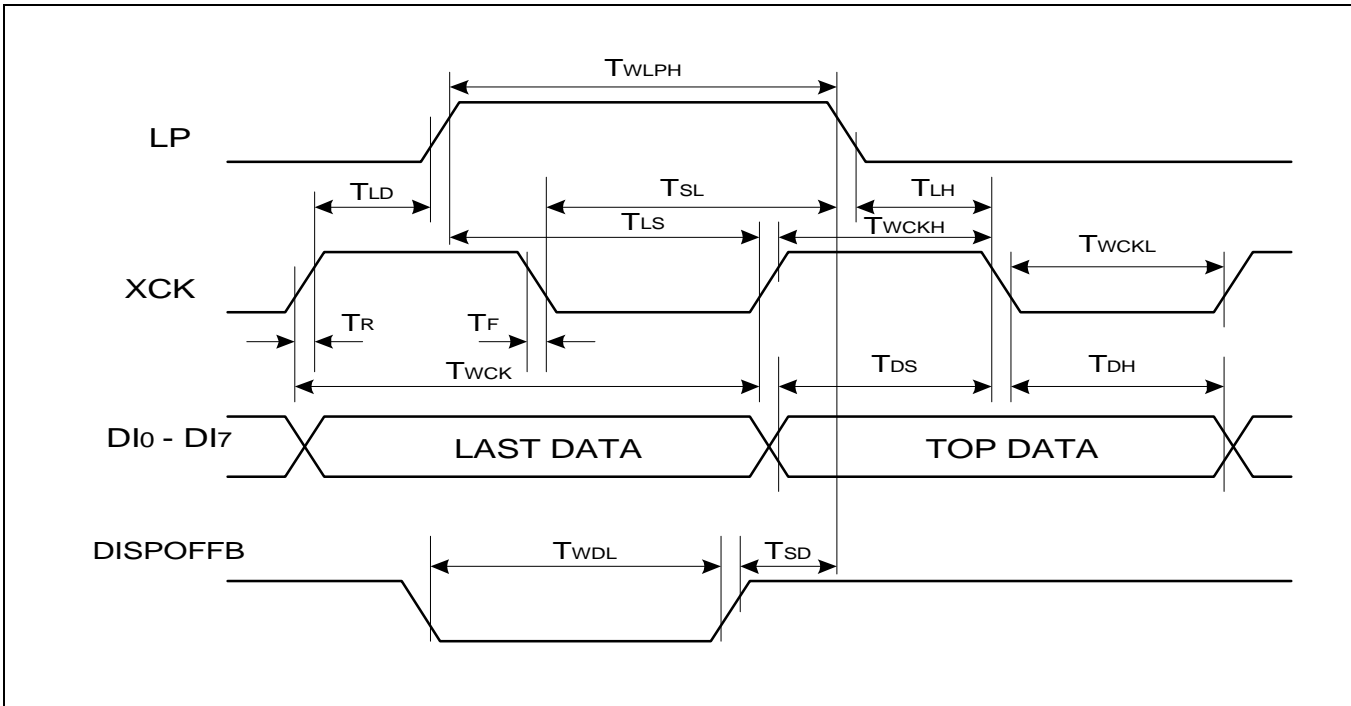

Figure 3. (Continued)

**COMMON MODE AC CHARACTERISTICS (Table 10)**

**Common Mode**

(VSS=V5=0V, VDD=+2.4V to +4.5V, V0=+15 to +32V, Ta=-20~85°C)

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
Shift clock period	TWLP	TR, TF≤20ns	250			ns
Shift clock "H" pulse width	TWLPH	VDD=+5.0V±10%	15			ns
		VDD=+2.5V~+4.5V	30			ns
Data setup time	TSU		30			ns
Data hold time	TH		50			ns
Input signal rise time	TR				50	ns
Input signal fall time	TF				50	ns
DISPOFFB removal time	TSD		100			ns
DISPOFFB 'L' pulse width	TWDL		1.2			us
Output delay time (1)	TDL	CL=15pF			200	ns
Output delay time (2)	TPD1,TPD2	CL=15pF			1.2	us
Output delay time (3)	TPD3	CL=15pF			1.2	us

**Timing Characteristics of Common Mode (Figure 4)**

Figure 4. (Continued)

## PRECAUTION

### . PRECAUTION WHEN CONNECTING OR DISCONNECTING THE POWER

This LSI has a high-voltage LC driver, so it may be permanently damaged by a high current which may flow if a voltage is supplied to the LC driver power supply while the logic system power supply is floating. The detail is as follows.

. When connecting the power supply, connect the LC drive power after connecting the logic system power. Furthermore, when disconnecting the power, disconnect the logic system power after disconnecting the LC driver power.

. We recommend you connecting the serial resistor (50~100Ω) or fuse to the LC drive power  $V_0$  of the system as a current limiter. And set up the suitable of the resistor in consideration of LC display grade.

And when connecting the logic power supply, the logic condition of this LSI inside is insecurity. Therefore connect the LC driver power supply after resetting logic condition of this LSI inside on DISPOFFB function. After that, cancel the DISPOFFB function after the LC driver power supply has become stable. Furthermore, when disconnecting the power, set the LC drive output pins to level  $V_5$  on DISPOFFB function. After that, disconnect the logic system power after disconnecting the LC drive power. When connecting the power supply, show the following recommend sequence.
