

ST7528

16 Gray Scale Dot Matrix LCD Controller/Driver

INTRODUCTION

The ST7528 is a driver & controller LSI for 16-level gray scale graphic dot-matrix liquid crystal display systems. It contains 2 Mode (160X100,132X128) for Segment and Common driver circuits. This chip is connected directly to a microprocessor, accepts Serial Peripheral Interface (SPI),IIC or 8-bit parallel display data and stores in an on-chip display data RAM of 160 x 129 x 4 bits. It performs display data RAM read/write operation with no external operating clock to minimize power consumption. In addition, because it contains power supply circuits necessary to drive liquid crystal, it is possible to make a display system with the fewest components.

FEATURES

16-level (White Mode ~ Dark Mode) Gray Scale Display with PWM and FRC Methods

DDRAM data [4n : 4n+3]				Gray Scale
4n	4n + 1	4n + 2	4n+ 3	
0	0	0	0	White Mode
0	0	0	1	Gray Level 1
0	0	1	0	Gray Level 2
:	:	:	:	:
:	:	:	:	:
1	1	0	1	Gray Level 13
1	1	1	0	Gray Level 14
1	1	1	1	Dark

(Mode0: Accessible column address, n = 0, 1, 2,, 129, 130, 131)

(Mode1: Accessible column address, n = 0, 1, 2,, 157, 158, 159)

Driver Output Circuits

–Mode 0 : 132 segment outputs / 128+1 common outputs (16-level gray scale)

–Mode 1: 160 segment outputs / 100+1 common outputs (16-level gray scale)

Applicable Duty Ratios

- Various partial display
- Partial window moving & data scrolling

On-chip Display Data RAM

- Capacity: 129 x 160 x 4 = 82,560 bits
- 16-Gray Level display dot is illuminated by 4 bit data control

ST7528

Microprocessor Interface

- 8-bit parallel bi-directional interface with 6800-series or 8080-series
- 4-line serial interface (4-line-SIF)
- 3-line serial interface (3-line-SIF)
- IIC serial interface

On-chip Low Power Analog Circuit

- On-chip oscillator circuit
- Voltage converter (x3, x4, x5 or x6)
- Voltage regulator (temperature coefficient: -0.125%/°C, or external input)
- On-chip electronic contrast control function (64 steps X 8)
- Voltage follower (LCD bias: 1/5 to 1/12)

Operating Voltage Range

- Supply voltage (VDD): 1.8 to 3.3V
(VDD2): 2.4 to 3.3V
- LCD driving voltage (VLCD = V0 - VSS): 4.0 to 18.0 V

Package Type

- Application for COG

ST7528	6800 , 8080 , 4-Line , 3-Line interface (without IIC interface)	
ST7528i	IIC interface	

ST7528 Pad Arrangement (COG)

Chip Size: 12,575 um × 1,220 um

Bump Pitch:

PAD NO 1 ~ 229, 353 ~ 385: 55 um (COM/SEG), PAD NO 230 ~ 352: 75 um (I/O) [PAD 338~339: 81um],

PAD NO 229 ~ 230: 84 um, PAD NO 352 ~ 353: 913 um

Bump Size:

PAD NO 1 ~ 196, 218 ~ 229, 353 ~ 364 : 35(x) um ×96(y) um PAD NO 197 ~ 217, 365 ~ 385 : 96(x) um ×35(y) um

PAD NO 230 ~ 352 : 55(x)um ×60(y) um

Bump Height: 18 um (Typical)

Chip Thickness: 635 um

L	8080-series	/RD	Read enable clock input pin When /RD is "L", DB0 to DB7 are in an output status.											
DB0 to DB7	I/O	<p>8-bit bi-directional data bus that is connected to the standard 8-bit microprocessor data bus. When chip select is not active (CSB=H), DB0 to DB7 may be high impedance.</p> <p>When the 3-Line/4-Line serial interface selected (PS[2:0] = "000" or "010");</p> <ul style="list-style-type: none"> – DB0 to DB5: high impedance – DB6: serial input clock (SCLK) – DB7: serial input data (SID) <p>When chip select is not active, D0 to D7 is high impedance.</p> <p>When the IIC serial interface selected (PS[2:0] = "100");</p> <p>D7: serial clock input (SCL) D6 , D5 , D4: serial input data (SDA_IN) D3, D2: (SDA_OUT) serial data acknowledge for the IIC interface. By connecting SDA_OUT to SDA_IN externally, the SDA line becomes fully IIC interface compatible. Having the acknowledge output separated from the serial data line is advantageous in chip on glass (COG) applications. In COG application where the track resistance from the SDA_OUT pad to the system SDA line can be significant, a potential divider is generated by the bus pull-up resistor and the ITO track resistance. It is possible during the acknowledge cycle the ST7528 will not be able to create a valid logic 0 level. By splitting the SDA_IN input from the SDA_OUT output the device could be used in a mode that ignores the acknowledge bit. In COG applications where the acknowledge cycle is required, it is necessary to minimize the track resistance from the SDA_OUT pad to the system SDA line to guarantee a valid low level.</p> <p><u>D6, D5,D2 must be connected together (SDA)</u> D1, D0: Is slave address (SA) bit1, 0, must connect to Vdd or Vss.</p> <p>When chip select is not active, D0 to D7 is high impedance.</p>

V1 , V2 , V3 , V4	<500Ω
RST	<10KΩ

FUNCTIONAL DESCRIPTION MICROPROCESSOR INTERFACE

Chip Select Input

There is CSB pin for chip selection. The ST7528 can interface with an MPU when CSB is "L". When these pins are set to any other combination, A0, E_RD, and RW_WR inputs are disabled and DB0 to DB7 are to be high impedance. And, in case of serial interface, the internal shift register and the counter are reset.

Parallel / Serial Interface

ST7528 has five types of interface with an MPU, which are three serial and two parallel interfaces. This parallel or serial interface is determined by PS pin as shown in Table 1.

Table 1 Parallel / Serial Interface Mode

Type	PS2	PS1	PS0	CSB	Interface mode
Parallel	L	H	H	CSB	6800-series MPU mode
	L	L			8080-series MPU mode
Serial	L	L	L	CSB	3-Line SPI mode
	L	H	L	CSB	4-Line SPI mode
	H	L	L	CSB	IIC SPI mode

Parallel Interface (PS0 = "H")

The 8-bit bi-directional data bus is used in parallel interface and the type of MPU is selected by PS1 as shown in Table 2. The type of data transfer is determined by signals at A0, E_RD and RW_WR as shown in Table 3.

Table 2 Microprocessor Selection for Parallel Interface

PS1	CSB	A0	E_RD	RW_WR	DB0 to DB7	MPU bus
H	CSB	A0	E	RW	DB0 to DB7	6800-series
L	CSB	A0	/RD	/WR	DB0 to DB7	8080-series

Table 3 Parallel Data Transfer

Common	6800-series		8080-series		Description
	E_RD (E)	RW_WR (RW)	E_RD (/RD)	RW_WR (/WR)	
A0					
H	H	H	L	H	Display data read out
H	H	L	H	L	Display data write
L	H	H	L	H	Register status read
L	H	L	H	L	Writes to internal register (instruction)

NOTE: When E_RD pin is always pulled high for 6800-series interface, it can be used CSB for enable signal. In this case, interface data is latched at the rising edge of CSB and the type of data transfer is determined by signals at A0, RW_WR as in case of 6800-series mode.

Serial Interface

3-Line / 4-Line (PS[2:0] = "000" or "010")

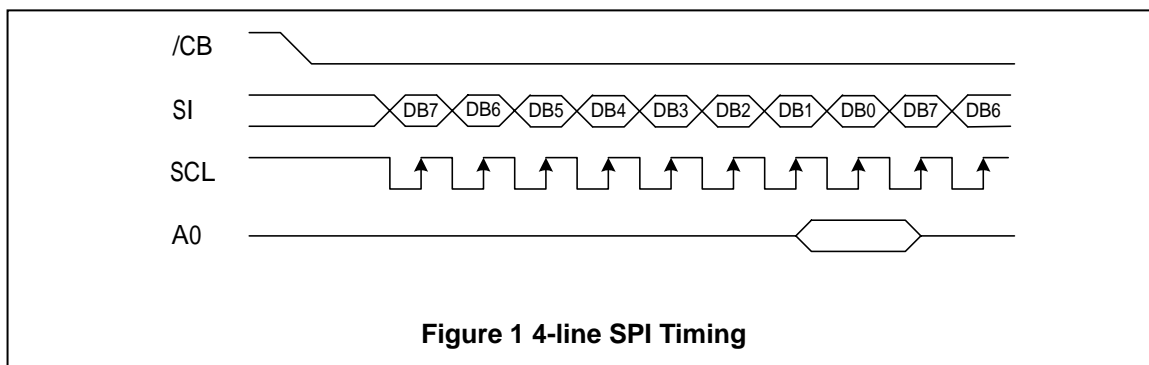

When the ST7528 is active (CSB="L"), serial data (DB7) and serial clock (DB6) inputs are enabled. And not active, the internal 8-bit shift register and the 3-bit counter are reset. The display data/command indication may be controlled either via software or the Register Select (A0) Pin, based on the setting of PS1. When the A0 pin is used (PS1 = "H"), data is display data when A0 is high, and command data when A0 is low. When A0 is not used (PS1 = "L"), the LCD Driver will receive command from MCU by default. If messages on the data pin are data rather than command, MCU should send Data Direction command (11101000) to control the data direction and then one more command to define the number of data bytes will be write. After these two continuous commands are sent, the following messages will be data rather than command. Serial data can be read on the rising edge of serial clock going into DB6 and processed as 8-bit parallel data on the eighth serial clock. And the DDRAM column address pointer will be increased by one automatically. The next bytes after the display data string is handled as command data.

In 3-Line mode, default message from MCU is command, the 2 bytes command of **Set Data Direction & Display Data Length** must be set before display data send from MCU, after the display data is sent over, the next message is turned to be command.

Serial mode	PS0	PS1	PS2	CSB	A0
3-Line SPI mode	L	L	L	CSB	No used
4-Line SPI mode	L	H	L	CSB	Used
IIC SPI mode	L	L	H	CSB	No Used

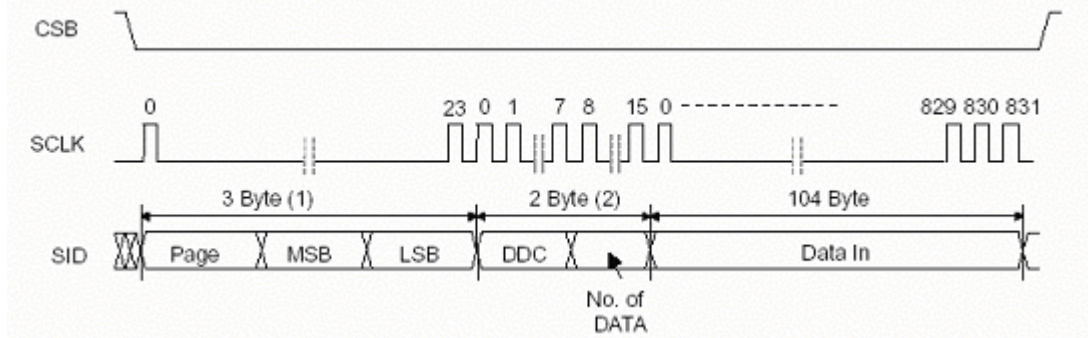

If A0 is not used it must be fixed either "H" or "L"

4-Line SPI Mode (PS0 = "L", PS1 = "H", PS2 = "L")

3-Line SPI Mode (PS0 = "L", PS1 = "L", PS2= "L")

To write data to the DDRAM, send Data Direction Command in 3-Line SPI mode. Data is latched at the rising edge of SCLK. And the DDRAM column address pointer will be increased by one automatically.

(1) Set Page and Column Address.

Set Page Address : 1 0 1 1 P3 P2 P1 P0
 Set Column Address MSB : 0 0 0 1 0 Y7 Y6 Y5
 Set Column Address LSB : 0 0 0 0 Y4 Y3 Y2 Y1

(2) Set DDC (Data Direction Command) and No. of Data Bytes.

Set Data Direction Command (For SPI mode Only):

1 1 1 0 1 0 0 0

Set No. of Data Bytes : D7 D6 D5 D4 D3 D2 D1 D0

(3) This figure is example for 104 Data bytes to be transferred.

Figure 2 3-pin SPI Timing (RS is not used)

This command is used in 3-Line SPI mode only. It will be two continuous commands, the first byte controls the data direction and informs the LCD driver the second byte will be number of data bytes will be write. After these two commands sending out, the following messages will be data. If data is stopped in transmitting, it is not valid data.

New data will be transferred serially with most significant bit first.

NOTE: In spite of transmission of data, if CSB is disabling, state terminates abnormally. Next state is initialized.

IIC Interface (PS0 = "L", PS1 = "L", PS2= "H")

The IIC interface receives and executes the commands sent via the IIC Interface. It also receives RAM data and sends it to the RAM.

The IIC Interface is for bi-directional, two-line communication between different ICs or modules. The two lines are a Serial Data line (SDA) and a Serial Clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy.

BIT TRANSFER

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse because changes in the data line at this time will be interpreted as a control signal. Bit transfer is illustrated in Figure 3.

START AND STOP CONDITIONS

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P). The START and STOP conditions are illustrated in Figure 4.

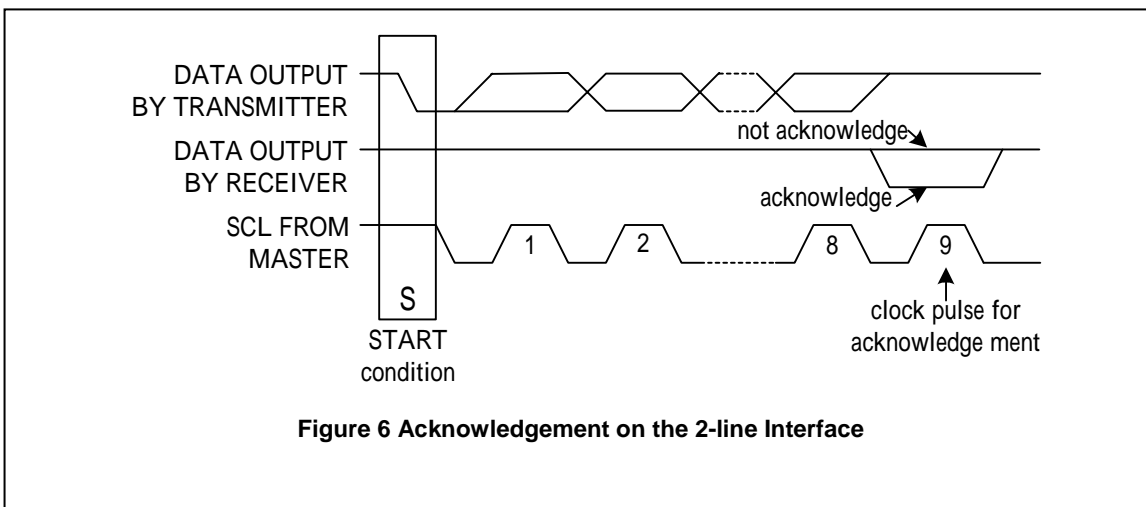

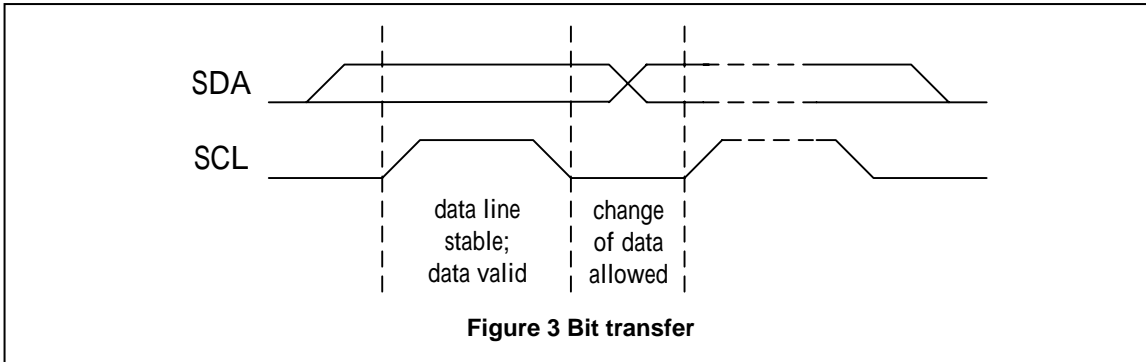

SYSTEM CONFIGURATION

The system configuration is illustrated in Figure 5.

- Transmitter: the device, which sends the data to the bus.
- Receiver: the device, which receives the data from the bus.
- Master: the device, which initiates a transfer, generates clock signals and terminates a transfer.
- Slave: the device addressed by a master.
- Multi-Master: more than one master can attempt to control the bus at the same time without corrupting the message.
- Arbitration: procedure to ensure that, if more than one master simultaneously tries to control the bus, only one is allowed to do so and the message is not corrupted.
- Synchronization: procedure to synchronize the clock signals of two or more devices.

ACKNOWLEDGE

Each byte of eight bits is followed by an acknowledge bit. The acknowledge bit is a HIGH signal put on the bus by the transmitter during which time the master generates an extra acknowledge related clock pulse. A slave receiver which is addressed must generate an acknowledge after the reception of each byte. A master receiver must also generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be taken into consideration). A master receiver must signal an end-of-data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event the transmitter must leave the data line HIGH to enable the master to generate a STOP condition. Acknowledgement on the IIC Interface is illustrated in Figure 6.

IIC Interface protocol

The ST7528 supports command, data write addressed slaves on the bus.

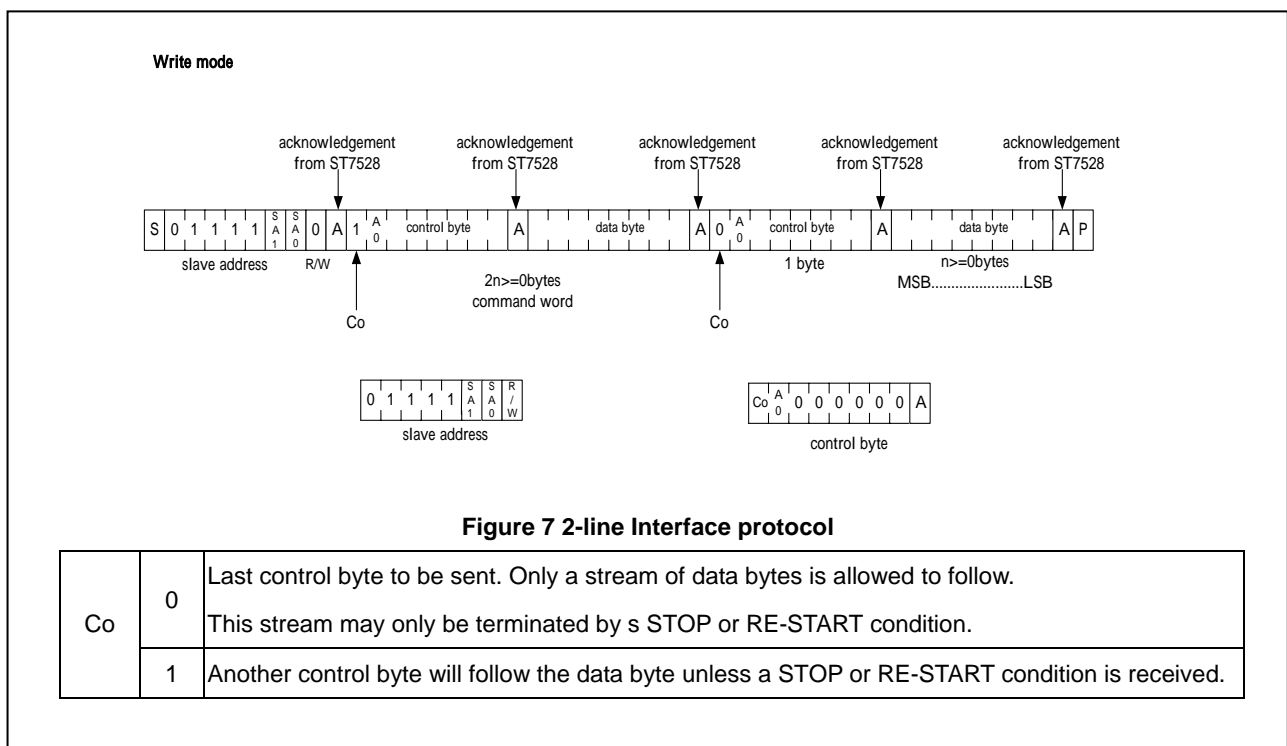

Before any data is transmitted on the IIC Interface, the device, which should respond, is addressed first. Four 7-bit slave addresses (0111100, 0111101, 0111110 and 0111111) are reserved for the ST7528. The least significant bit of the slave address is set by connecting the input SA0 and SA1 to either logic 0 (VSS) or logic 1 (VDD).

The IIC Interface protocol is illustrated in Figure 7.

The sequence is initiated with a START condition (S) from the IIC Interface master, which is followed by the slave address. All slaves with the corresponding address acknowledge in parallel, all the others will ignore the IIC Interface transfer. After acknowledgement, one or more command words follow which define the status of the addressed slaves.

A command word consists of a control byte, which defines Co and A0, plus a data byte.

The last control byte is tagged with a cleared most significant bit (i.e. the continuation bit Co). After a control byte with a cleared Co bit, only data bytes will follow. The state of the A0 bit defines whether the data byte is interpreted as a command or as RAM data. All addressed slaves on the bus also acknowledge the control and data bytes. After the last control byte, depending on the A0 bit setting; either a series of display data bytes or command data bytes may follow. If the A0 bit is set to logic 1, these display bytes are stored in the display RAM at the address specified by the data pointer. The data pointer is automatically updated and the data is directed to the intended ST7528 device. If the A0 bit of the last control byte is set to logic 0, these command bytes will be decoded and the setting of the device will be changed according to the received commands. Only the addressed slave makes the acknowledgement after each byte. At the end of the transmission the IIC INTERFACE-bus master issues a STOP condition (P). If the R/W bit is set to logic 1 the chip will output data immediately after the slave address if the A0 bit, which was sent during the last write access, is set to logic 0. If no acknowledge is generated by the master after a byte, the driver stops transferring data to the master.

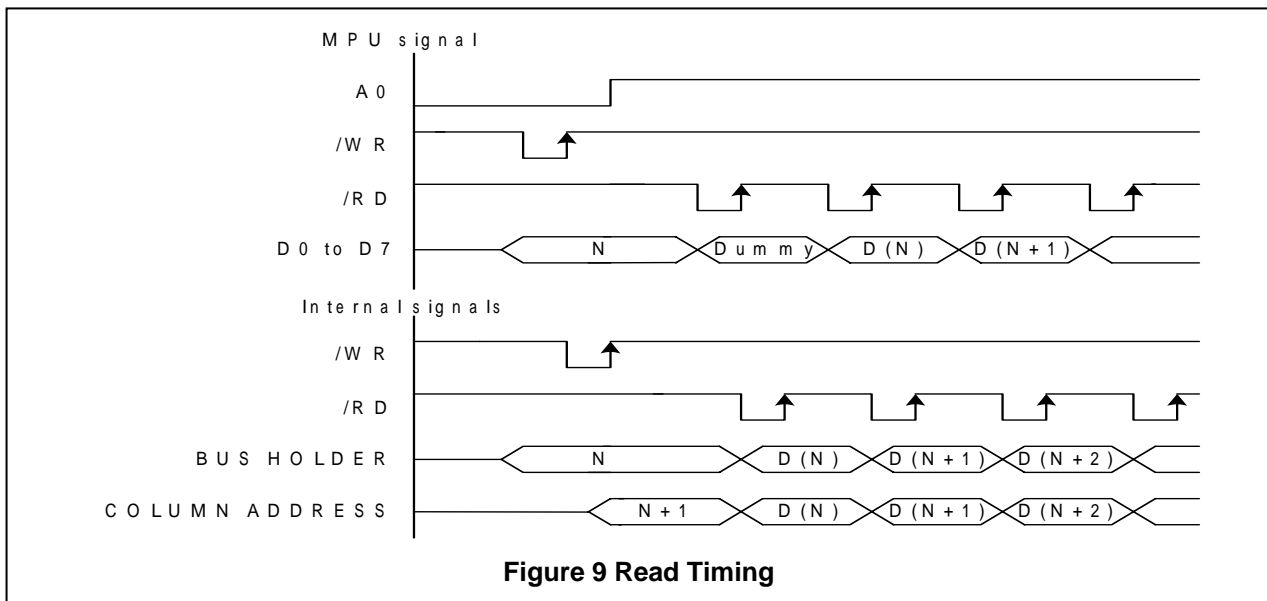

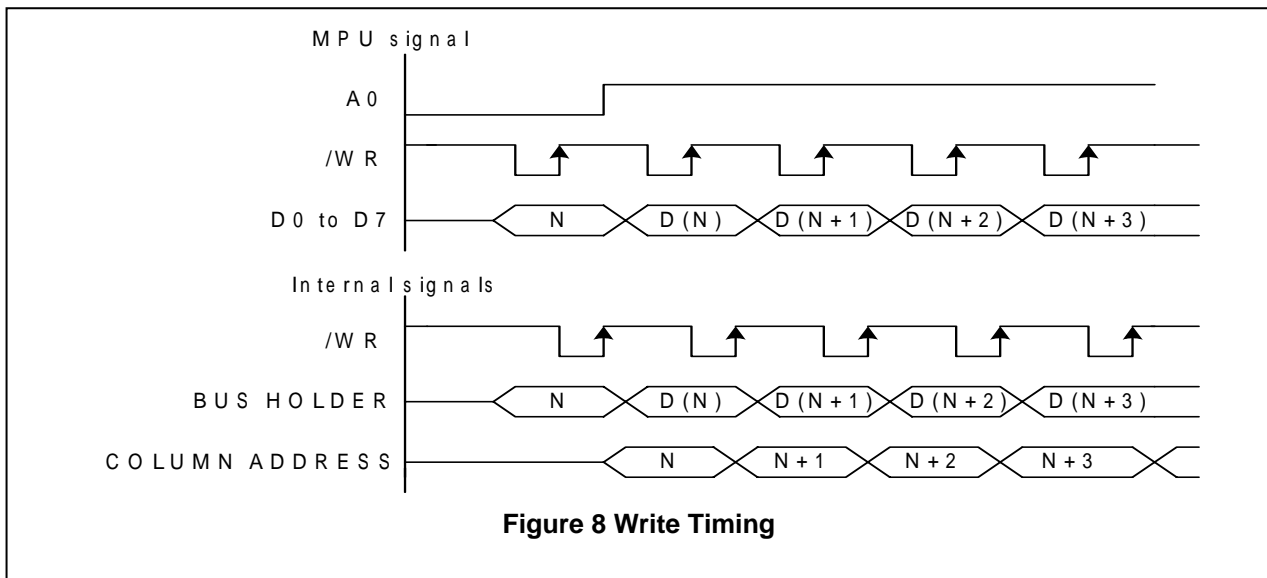

Busy Flag

The Busy Flag indicates whether the ST7528 is operating or not. When DB7 is "H" in read status operation, this device is in busy status and will accept only read status instruction. If the cycle time is correct, the microprocessor needs not to check this flag before each instruction, which improves the MPU performance.

Data Transfer

The ST7528 uses bus holder and internal data bus for data transfer with the MPU. When writing data from the MPU to on-chip RAM, data is automatically transferred from the bus holder to the RAM as shown in Figure 8. And when reading data from on-chip RAM to the MPU, the data for the initial read cycle is stored in the bus holder (dummy read) and the MPU reads this stored data from bus holder for the next data read cycle as shown in Figure 9. This means that a dummy read cycle must be inserted between each pair of address sets when a sequence of address sets is executed. Therefore, the data of the specified address cannot be output with the read display data instruction right after the address sets, but can be output at the second read of data.

DISPLAY DATA RAM (DDRAM)

When Mode 0 is selected

The Display Data RAM stores pixel data for the LCD. It is 129-row (17 pages by 8 bits) by 132-column addressable array. Each pixel can be selected when the page and column addresses are specified. The 129 rows are divided into 16 pages of 8 lines and the 17th page with a single line (DB0 only). Data is read from or written to the 8 lines of each page directly through DB0 to DB7. The display data of DB0 to DB7 from the microprocessor correspond to the LCD common lines. The microprocessor can read from and write to RAM through the I/O buffer. Since the LCD controller operates independently, data can be written into RAM at the same time as data is being displayed without causing the LCD flicker.

When Mode 1 is selected

The Display Data RAM stores pixel data for the LCD. It is 101-row (13 pages by 8 bits) by 160-column addressable array. Each pixel can be selected when the page and column addresses are specified. The 101 rows are divided into 12 pages of 8 lines and the 13th page with 4 lines; the Page Address 16 (17th page) is for Icon page with a single line (DB0 only). Data is read from or written to the 8 lines of each page directly through DB0 to DB7. The display data of DB0 to DB7 from the microprocessor correspond to the LCD common lines. The microprocessor can read from and write to RAM through the I/O buffer. Since the LCD controller operates independently, data can be written into RAM at the same time as data is being displayed without causing the LCD flicker.

Page Address Circuit

In mode 0

It incorporates 4-bit Page Address register changed by only the "Set Page" instruction. Page Address 16 is a special RAM area for the icons and display data DB0 is only valid. The page address is set from 0 to 15, and Page 16 is for Icon page.

In mode 1

It incorporates 4-bit Page Address register changed by only the "Set Page" instruction. Page Address 16 is a special RAM area for the icons and display data DB0 is only valid. The page address is set from 0 to 12, and Page 16 is for Icon page.

Line Address Circuit

In mode 0

This circuit assigns DDRAM a Line Address corresponding to the first line (COM0) of the display. Therefore, by setting Line Address repeatedly, it is possible to realize the screen scrolling and page switching without changing the contents of on-chip RAM. It incorporates 7-bit Line Address register changed by only the initial display line instruction and 7-bit counter circuit. At the beginning of each LCD frame, the contents of register are copied to the line counter which is increased by CL signal and generates the line address for transferring the 128-bit RAM data to the display data latch circuit. When icon is enabled by setting icon control register, display data of icons are not scrolled because the MPU can not access Line Address of icons.

In mode 1

The 7-bit Line Address register is set from 0 ~ 99, If the register is set from 100 ~ 127, It will be no operation. The register value will be kept in last value.

Column Address Circuit

In Mode 0, 1

Column Address Circuit has a 10-bit preset counter that provides Column Address to the Display Data RAM. When set Column Address MSB / LSB instruction is issued, 8-bit [Y9:Y2] are set and lowest 2 bit, Y[1:0] is set to "00". Since this address is increased by 1 each a read or write data instruction, microprocessor can access the display data continuously. However, the counter is not increased and locked if a non-existing address above 9FH. It is unlocked if a column address is set again by set Column Address MSB / LSB instruction. And the column address counter is independent of page address register.

ADC select instruction makes it possible to invert the relationship between the Column Address and the segment outputs. It is necessary to rewrite the display data on built-in RAM after issuing ADC select instruction. Refer to the following Figure 10 and Figure 11.

(Note: in mode read or write in fourth, the column address will turn to next column address)

LCD DISPLAY CIRCUITS

FRC (Frame Rate Control) and PWM (Pulse Width Modulation) Function Circuit

The ST7528 incorporates an FRC function and a PWM function circuit to display a 16-level gray scale. The FRC function and PWM utilize liquid crystal characteristics whose transmittance is changed by an effective value of applied voltage. The ST7528 provides palette-registers to assign the desired gray level. These registers are set by the instructions and the RESETB.

Oscillator

This is on-chip Oscillator without external resistor. When the internal oscillator is used, this pin must connect to VDD; when the external oscillator is used, this pin could be input pin. This oscillator signal is used in the voltage converter and display timing generation circuit.

Display Timing Generator Circuit

This circuit generates some signals to be used for displaying LCD. The display clock, CL (internal), generated by oscillation clock, generates the clock for the line counter and the signal for the display data latch. The line address of on-chip RAM is generated in synchronization with the display clock and the display data latch circuit latches the 128-bit display data in synchronization with the display clock. The display data, which is read to the LCD driver, is completely independent of the access to the display data RAM from the microprocessor. The display clock generates an LCD AC signal (M) which enables the LCD driver to make an AC drive waveform, and also generates an internal common timing signal and start signal to the common driver. The frame signal or the line signal changes the M by setting internal instruction. Driving waveform and internal timing signal are shown in Figure 12.

Figure 12 2-frame AC Driving Waveform (Duty Ratio: 1/129)

Figure 13 N-Line Inversion Driving Waveform (N=5, Duty Ratio=1/129)

LCD DRIVER CIRCUIT

This driver circuit is configured by 129-channel common drivers and 160-channel segment drivers. This LCD panel driver voltage depends on the combination of display data and M signal.

Partial Display on LCD

The ST7528 realizes the Partial Display function on LCD with low-duty driving for saving power consumption and showing the various display duty. To show the various display duty on LCD, LCD driving duty and bias are programmable via the instruction. And, built-in power supply circuits are controlled by the instruction for adjusting the LCD driving voltages.

In mode 0 the partial display duty ratio could be set from 16 ~ 128.

In mode 1 could be set from 16 ~ 100.

If the partial display region is out of the Max. Display range, it would be no operation.

POWER SUPPLY CIRCUITS

The Power Supply circuits generate the voltage levels necessary to drive liquid crystal driver circuits with low power consumption and the fewest components. There are voltage converter circuits, voltage regulator circuits, and voltage follower circuits. They are controlled by power control instruction. For details, refers to "Instruction Description". Table 4 shows the referenced combinations in using Power Supply circuits.

Table 4 Recommended Power Supply Combinations

User setup	Power control (VC VR VF)	V/C circuits	V/R circuits	V/F circuits	VOUT_IN	V0	V1 to V4
Only the internal power supply circuits are used	1 1 1	ON	ON	ON	Internal	Without capacitor	With capacitor

Only the external power supply circuits are used	0 0 0	OFF	OFF	OFF	OPEN	External input	External input

Voltage Converter Circuits

These circuits boost up the electric potential between VDD2 and Vss to 3, 4, 5 or 6 times toward positive side and boosted voltage is outputted from VOUT pin. It is possible to select the lower boosting level in any boosting circuit by "Set DC-DC Step-up" instruction. When the higher level is selected by instruction, VOUT voltage is not valid.

Note: we would like to recommend to use the external VOUT when the panel is large than 1.8 inch

Voltage Regulator Circuits

The function of the internal Voltage Regulator circuits is to determine liquid crystal operating voltage, V0, by adjusting resistors, Ra and Rb, within the range of $|V0| < |VOUT|$. Because VOUT is the operating voltage of operational-amplifier circuits shown in Figure 17, it is necessary to be applied internally or externally.

For the Eq. 1, we determine V0 by Ra, Rb and VEV. The Ra and Rb are connected internally or externally by INTR pin. And VEV called the voltage of electronic volume is determined by Eq. 2, where the parameter α is the value selected by instruction, "Set Reference Voltage Register", within the range 0 to 63. VREF voltage at Ta= 25°C is shown in Table 5.

$$V0 = \left(1 + \frac{Rb}{Ra}\right) \times VEV \text{ [V]} \text{ ----- (Eq. 1)}$$

$$VEV = \left(1 - \frac{1}{210}\right) \times VREF \text{ [V]} \text{ ----- (Eq. 2)}$$

Table 5 VREF Voltage at Ta = 25°C

REF	Temp. coefficient	VREF [V]
1	-0.125% / °C	2.1
0	External input	VEXT

Figure 17 Internal Voltage Regulator Circuit

In Case of Using Internal Resistors, Ra and Rb (INTRS = "H")

When INTRS pin is "H", resistor Ra is connected internally between VR pin and VSS, and Rb is connected between V0 and VR. We determine V0 by two instructions, "Regulator Resistor Select" and "Set Reference Voltage".

Table 6 Internal Rb / Ra Ratio depending on 3-bit Data (R2 R1 R0)

	3-bit data settings (R2 R1 R0)							
	0 0 0	0 0 1	0 1 0	0 1 1	1 0 0	1 0 1	1 1 0	1 1 1
1 + (Rb / Ra)	2.3	3.0	3.7	4.4	5.1	5.8	6.5	7.2

Figure 18 shows V0 voltage measured by adjusting internal regulator register ratio (Rb / Ra) and 6-bit electronic volume registers for each temperature coefficient at Ta = 25 °C.

Figure 18 Electronic volume register (0 to 63)

In Case of Using External Resistors, Ra and Rb (INTRS = "L")

When INTRS pin is "L", it is necessary to connect external regulator resistor Ra between VR and VSS, and Rb between V0 and VR.

Example: For the following requirements

1. LCD driver voltage, V0 = 10V
2. 6-bit reference voltage register = (1, 0, 0, 0, 0, 0)
3. Maximum current flowing Ra, Rb = 1 uA

From Eq. 1

$$10 = \left(1 + \frac{R_b}{R_a}\right) \times V_{EV} [V] \text{ ----- (Eq. 3)}$$

From Eq. 1

$$V_{EV} = \left(1 - \frac{(63 - 32)}{210}\right) \times 2.1 = 1.79 [V] \text{ ----- (Eq. 4)}$$

From requirement 3.

$$\frac{10}{R_a + R_b} = 1 [\mu A] \text{ ----- (Eq. 5)}$$

Ra + Rb

From equations Eq. 3, 4 and 5

$$R_a = 1.79 [M\Omega]$$

$$R_b = 8.21 [M\Omega]$$

Table 7 Shows the Range of V0 depending on the above Requirements.

Table 7 The Range of V0

	Electronic volume level				
	0	32	63
V0	8.21	10.00	11.73

Voltage Follower Circuits

VLCD voltage (V0) is resistively divided into four voltage levels (V1, V2, V3 and V4), and those output impedance are converted by the Voltage Follower for increasing drive capability. Table 8 shows the relationship between V1 to V4 level and each duty ratio.

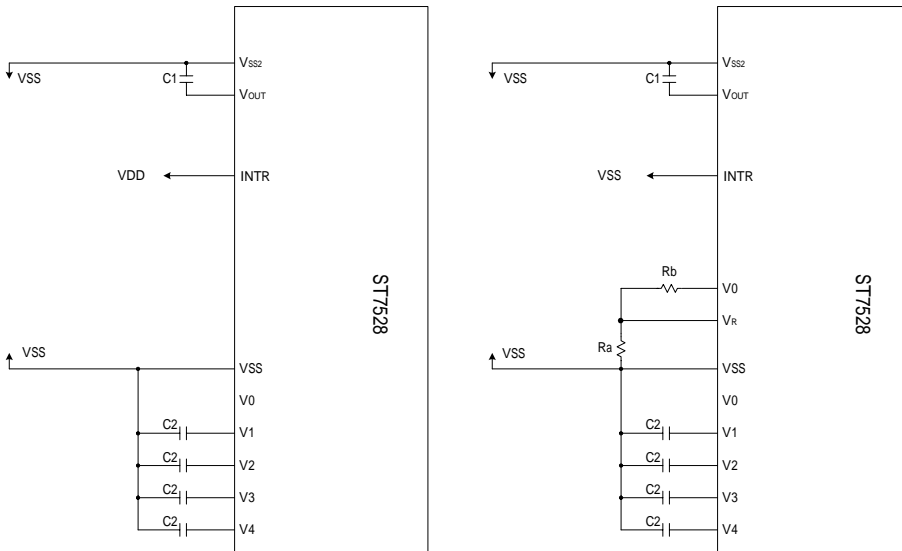

Table 8 The Relationship between V1 to V4 Level and Each Duty Ratio

LCD bias	V1	V2	V3	V4	Remarks
1/N	(N-1)/N x V0	(N-2)/N x V0	2/N x V0	1/N x V0	N = 5 to 12

Bias Power Save circuit:

When we set the Instruction of Bias Power Save, the bias also could be working, and the IC current consumption will be lower about 100uA to 200uA (according to the panel loading)

Follower voltage reference circuit (Internal Booster & Regulator)

Left is using internal Resistor

Right is using External Resistor

$C1 = 1\mu F \sim 4.7\mu F$, $C2 = 0.1\mu F \sim 1\mu F$ (suggestion value: $C1=1\mu F$, $C2=0.1\mu F$)

Follower voltage reference circuit (External Vout & Internal Regulator)

Left is using internal Resistor

Right is using External Resistor

$C1 = 1\mu F \sim 4.7\mu F$, $C2 = 0.1\mu F \sim 1\mu F$ (suggestion value: $C1=1\mu F$, $C2=0.1\mu F$)

Booster Efficiency

By Booster Stages (3X, 4X, 5X, 6X) and Booster Efficiency (Level1~2) commands, we could easily set the best Booster performance with suitable current consumption. If the Booster Efficiency is set to higher level (level2 is higher than level1), The Boost Efficiency is better than lower level, and it just need few more power consumption current. It could be applied to each multiple voltage Condition.

When the LCD Panel loading is heavier, then the Performance of Booster will be not in a good working condition. We could set the BE level to be higher. We do not need to change to higher Booster Stage, and just need few more current.

The Booster Efficiency Command could be used together with Booster Stage Command to choose one best Boost output condition. We could see the Boost Stage Command as a large scale operation, and see the Booster Efficiency Command as a small scale operation. These commands are very convenient for using.

RESET CIRCUIT

Setting RESETB to "L" or Reset instruction can initialize internal function.

When RESETB becomes "L", following procedure is occurred.

Page address: 0

Column address: 0

Read-modify-write: OFF

Display ON / OFF: OFF

Initial display line: 0 (first)

Initial COM0 register: 0 (COM0)

Partial display duty ratio: 1/128

Reverse display ON / OFF: OFF (normal)

N-line inversion register: 0 (disable)

Entire Display ON/OFF: OFF

ICON Control register ON/OFF: OFF (ICON disable)

Power control register (VC, VR, VF) = (0, 0, 0)

DC-DC converter circuit = (0, 0)

Booster Efficiency BE = (1)

Regulator resistor select register: (R2, R1, R0) = (0, 0, 0)

Contrast Level: 32

LCD bias ratio: 1/12

COM Scan Direction: 0

ADC Select: 0

Oscillator: OFF

Power Save Mode: Release

Display Data Length register: 0 (for SPI mode)

All Gray Level Set : OFF

In Level0, 2, 4, 6, 8, 10, 12, 14, the Gray Level palette register (GA5, GA4, GA3, GA2, GA1, GA0) = (0,0,0,0,0)

All Gray Level Set : OFF

In Level1, 3, 5, 7, 9, 11, 13, 15, the Gray Level palette register (GA5, GA4, GA3, GA2, GA1, GA0) = (1,1,1,1,1)

FRC, PWM mode: 4FRC, 45PWM

When RESET instruction is issued, following procedure is occurred.

Page address: 0

Column address: 0

Read-modify-write: OFF

Initial display line: 0 (First)

Regulator resistor select register: (R2, R1, R0) = (0, 0, 0)

Contrast Level: 32

Display Data Length register: 0 (for SPI mode)

All Gray Level Set : OFF

In Level0, 2, 4, 6, 8, 10, 12, 14, the Gray Level palette register (GA5, GA4, GA3, GA2, GA1, GA0) = (0,0,0,0,0)

All Gray Level Set : OFF

In Level1, 3, 5, 7, 9, 11, 13, 15, the Gray Level palette register (GA5, GA4, GA3, GA2, GA1, GA0) = (1,1,1,1,1)

FRC, PWM mode: 4FRC, 45PWM

While RESETB is "L" or reset instruction is executed, no instruction except read status can be accepted. Reset status appears at DB4. After DB4 becomes "L", any instruction can be accepted. RESETB must be connected to the reset pin of the MPU, and initialize the MPU and this LSI at the same time. The initialization by RESETB is essential before used.

1	1	0	1	102 Hz ±20%
1	1	1	0	113 Hz ±20%
1	1	1	1	123 Hz ±20%

Booster Efficiency

The ST7528 incorporates software configurable Booster Efficiency Command. It could be used with Voltage multiplier to get the suitable Vout and Power consumption. Default setting is Level 2

Flag	Description	
BE	0	Booster Efficiency Level 1
	1	Booster Efficiency Level 2

Mode Set

Flag	Description	
EXT	Default	EXT=0
	EXT=0	The Instruction of EXT=0 Mode is available
	EXT=1	The Instruction of EXT=1 Mode is available

Read Display Data

8-bit data from Display Data RAM specified by the column address and page address can be read by this instruction. As the column address is increased by 1 automatically after each this instruction, the microprocessor can continuously read data from the addressed page. A dummy read is required after loading an address into the column address register. Display Data cannot be read through the serial interface.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	Read data							

Write Display Data

8-bit data of Display Data from the microprocessor can be written to the RAM location specified by the column address and page address. The column address is increased by 1 automatically so that the microprocessor can continuously write data to the addressed page. During auto-increment, the column address wraps to 0 after the last column is written.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	Write data

ST7528

Read Status

Indicates the internal status of the ST7528

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BUSY	ON	RES	MF2	MF1	MF0	DS1	DS0

Flag	Description
BUSY	The device is busy when internal operation or reset. Any instruction is rejected until BUSY goes Low. 0: chip is active, 1: chip is being busy
ON	Indicates display ON / OFF status 0: display OFF, 1: display ON
RESET	Indicates the initialization is in progress by RESET signal. 0: chip is active, 1: chip is being reset
MF	Manufacturer ID; recommended value: MF2 MF1 MF0 = [0 0 0] The value of MF2, MF1 and MF0 will follow the hardware selection.
DS	Display size ID; recommended value: DS1 DS0 = [1 0] The value of DS1 and DS2 will follow the hardware selection.

ICON Control Register ON/OFF

This instruction makes ICON enable or disable. By default, ICON display is disabled (ICON= 0). When ICON control register is set to "1", ICON display is enabled and page address is set to "16". Then user can write data for icons. It is impossible to set the page address to "16" by Set Page Address instruction. Therefore, when writing data for icons, ICON control register ON instruction would be used to set the page address to "16". When ICON control register is set to "0", ICON display is disabled.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	0	1	ICON

ICON=0: ICON disable (default)

ICON=1: ICON enable & set the page address to 16

Set Page Address

Sets the Page Address of display data RAM from the microprocessor into the page address register. Any RAM data bit can be accessed when its Page Address and column address are specified. Along with the column address, the Page Address defines the address of the display RAM to write or read display data. Changing the Page Address doesn't affect the display status. Set Page Address instruction can not be used to set the page address to "16". Use ICON control register ON/OFF instruction to set the page address to "16".

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	1	P3	P2	P1	P0

P3	P2	P1	P0	Page

0	0	0	1	1
:	:	:	:	:
1	1	1	0	14
1	1	1	1	15

Set Column Address

Sets the Column Address of display RAM from the microprocessor into the column address register. Along with the Column Address, the Column Address defines the address of the display RAM to write or read display data.

When the microprocessor reads or writes display data to or from display RAM, Column Addresses are automatically increased.

Set Column Address MSB

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0

1	0	0	1	1	1	1	0	158
1	0	0	1	1	1	1	1	159

Set Modify-Read

This instruction stops the automatic increment of the column address by the read display data instruction, but the column address is still increased by the write display data instruction. And it reduces the load of microprocessor when the data of a specific area is repeatedly changed during cursor blinking or others. This mode is canceled by the reset Modify-Read instruction.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	0	0

Reset Modify-Read

This instruction cancels the Modify-Read mode, and makes the column address return to its initial value just before the set Modify-Read instruction is started.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	1	1	1	0

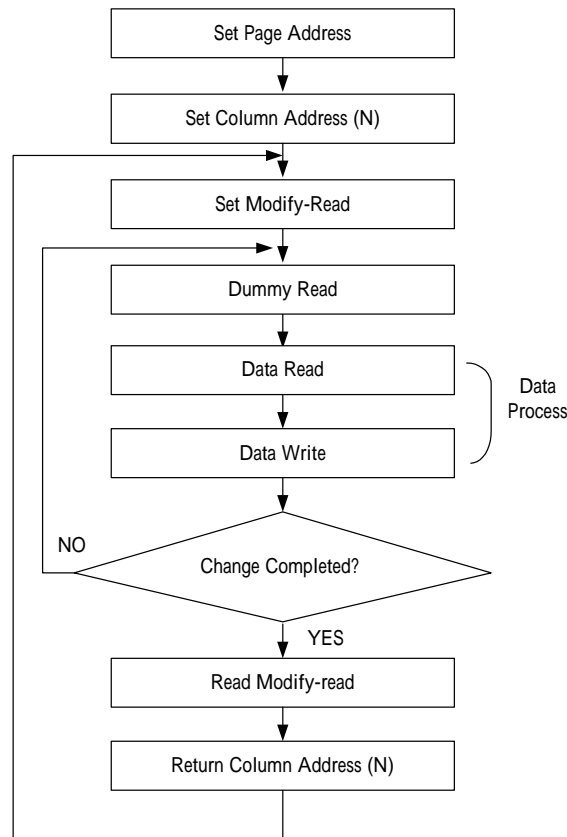

Figure 20 Sequence for Cursor Display

Display ON / OFF

Turns the display ON or OFF.

This command has priority over Entire Display On/Off and Reverse Display On/Off. Commands are accepted while the display is off, but the visual state of the display does not change.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0

1	1	1	1	1	1	1	1			

Set N-line Inversion Register

Sets the inverted line number within range of 3 to 33 to improve the display quality by controlling the phase of the internal LCD AC signal (M) by using the 2-byte instruction.

The DC-bias problem could be occurred if K is even number. So, we recommend customers to set K to be odd number. K : D/N

D : The number of display duty ratio (D is selectable by customers)

N : N for N-line inversion (N is selectable by customers).

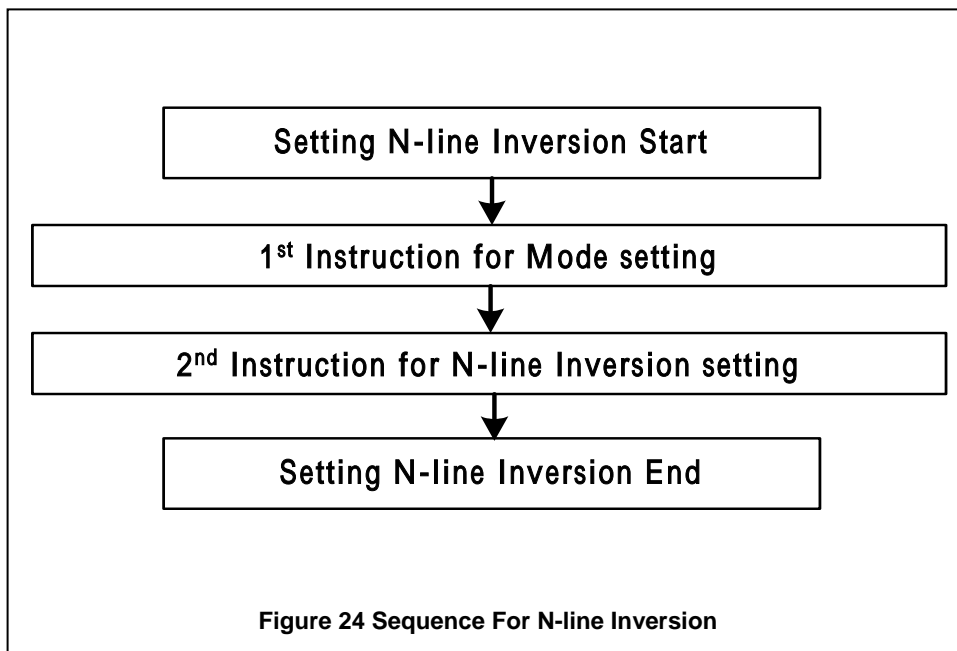

The 1st Instruction

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	0	1	1	x	x

The 2nd Instruction

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	x	x	x	0	0	0	0	0

N4	N3	N2	N1	N0	Selected n-line inversion
0	0	0	0	0	0-line inversion (frame inversion)
0	0	0	0	1	3-line inversion
0	0	0	1	0	4-line inversion
0	0	0	1	1	5-line inversion
:	:	:	:	:	:
1	1	1	0	1	31-line inversion
1	1	1	1	0	32-line inversion
1	1	1	1	1	33-line inversion

Release N-line Inversion

Returns to the frame inversion condition from the n-line inversion condition.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	1	0	0

Reverse Display ON / OFF

Reverses the display status on LCD panel without rewriting the contents of the display data RAM.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	1	1	REV

REV	White	Gray level 1	Gray level 14	- Dark
0 (normal)	White ("0000")	Gray 1 ("0001")	Gray 14 ("1110")	Dark ("1111")
1 (reverse)	Dark ("1111")	Gray 14 ("1110")	Gray 1 ("0001")	White ("0000")

Entire Display ON / OFF

Forces the whole LCD points to be turned on regardless of the contents of the display data RAM. At this time, the contents of the display data RAM are held. This instruction has priority over the Reverse Display ON / OFF instruction.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	1	0	EON

Entire	White	Gray level 1	Gray level 14	- Dark
0 (normal)	White ("0000")	Gray 1 ("0001")	Gray 14 ("1110")	Dark ("1111")
1 (Entire)	Dark ("1111")	Dark ("1111")	Dark ("1111")	Dark ("1111")	Dark ("1111")

Power Control

Selects one of eight power circuit functions by using 3-bit register. An external power supply and part of internal power supply functions can be used simultaneously.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	0	1	VC	VR	VF

VC	VR	VF	Status of internal power supply circuits
0			Internal voltage converter circuit is OFF
1			Internal voltage converter circuit is ON
	0		Internal voltage regulator circuit is OFF
	1		Internal voltage regulator circuit is ON
		0	Internal voltage follower circuit is OFF
		1	Internal voltage follower circuit is ON

ST7528

Set Bias Power Save Instruction

Consist of 2-byte Instructions

The 1st Instruction

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	1	0	0	1	1

The 2nd Instruction

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	0

This command is for saving the IC current consumption by Bias Power Saving

After this Instruction is set, Bias function is also working

Select DC-DC Step-up

Selects one of 4 DC-DC step-up to reduce the power consumption by this instruction. It is very useful to realize the partial display function.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	1	0	0	1	DC1	DC0

DC1	DC0	Selected DC-DC converter circuit
0	0	3 times boosting circuit
0	1	4 times boosting circuit
1	0	5 times boosting circuit
1	1	6 times boosting circuit

Select Regulator Resistor

Selects resistance ratio of the internal resistor used in the internal voltage regulator. See voltage regulator section in power supply circuit. Refer to the Table 6.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	0	0	R2	R1	R0

R2	R1	R0	1+ (Rb / Ra)
0	0	0	2.3
0	0	1	3.0
0	1	0	3.7
0	1	1	4.4
1	0	0	5.1
1	0	1	5.8
1	1	0	6.5
1	1	1	7.2

Set Electronic Volume Register

Consist of 2-byte Instructions

The 1st instruction set Reference Voltage mode, the 2nd one updates the contents of reference voltage register.

After second instruction, Reference Voltage mode is released.

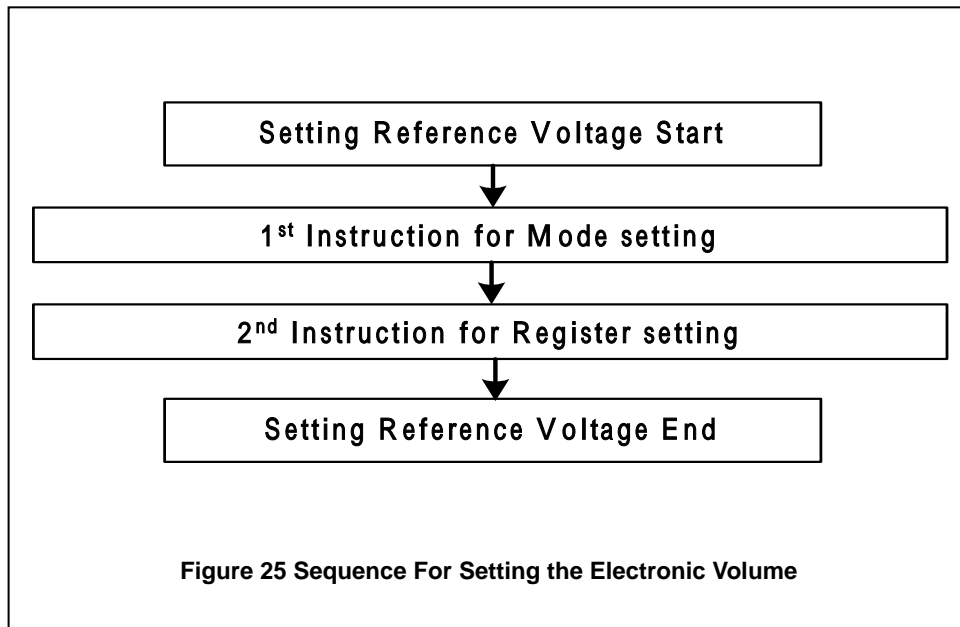

The 1st Instruction: Set Reference Voltage Select Mode

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	0	0	0	0	0	1

The 2nd Instruction: Set Reference Voltage Register

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	x	x	EV5	EV4	EV3	EV2	EV1	EV0

EV5	EV4	EV3	EV2	EV1	EV0	Reference voltage parameter (a)
0	0	0	0	0	0	0
0	0	0	0	0	1	1
:	:	:	:	:	:	:
:	:	:	:	:	:	:
1	1	1	1	1	0	62
1	1	1	1	1	1	63

ST7528

Select LCD Bias

Selects LCD bias ratio of the voltage required for driving the LCD.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	1	0	B2	B1	B0

B2	B1	B0	LCD bias
0	0	0	1/5
0	0	1	1/6
0	1	0	1/7
0	1	1	1/8
1	0	0	1/9
1	0	1	1/10
1	1	0	1/11
1	1	1	1/12

SHL Select

COM output scanning direction is selected by this instruction which determines the LCD driver output status.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	0	0	SHL	x	x	x

In Mode 0

SHL = 0: normal direction (COM0 → COM127)

SHL = 1: reverse direction (COM127 → COM0)

In Mode 1

SHL = 0: normal direction (COM0 → COM99)

SHL = 1: reverse direction (COM99 → COM0)

ADC Select

Changes the relationship between RAM column address and segment driver. The direction of segment driver output pins could be reversed by software. This makes IC layout flexible in LCD module assembly.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	0	0	ADC

In Mode 0

ADC = 0: normal direction (SEG0 → SEG127)

ADC = 1: reverse direction (SEG127 → SEG0)

In Mode 1

SHL = 0: normal direction (COM0 → COM99)

SHL = 1: reverse direction (COM99 → COM0)

Oscillator ON Start

This instruction enables the built-in oscillator circuit.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	1	0	1	1

Power Save

The ST7528 enters the Power Save status to reduce the power consumption to the static power consumption value and returns to the normal operation status by the following instructions.

Set Power Save Mode

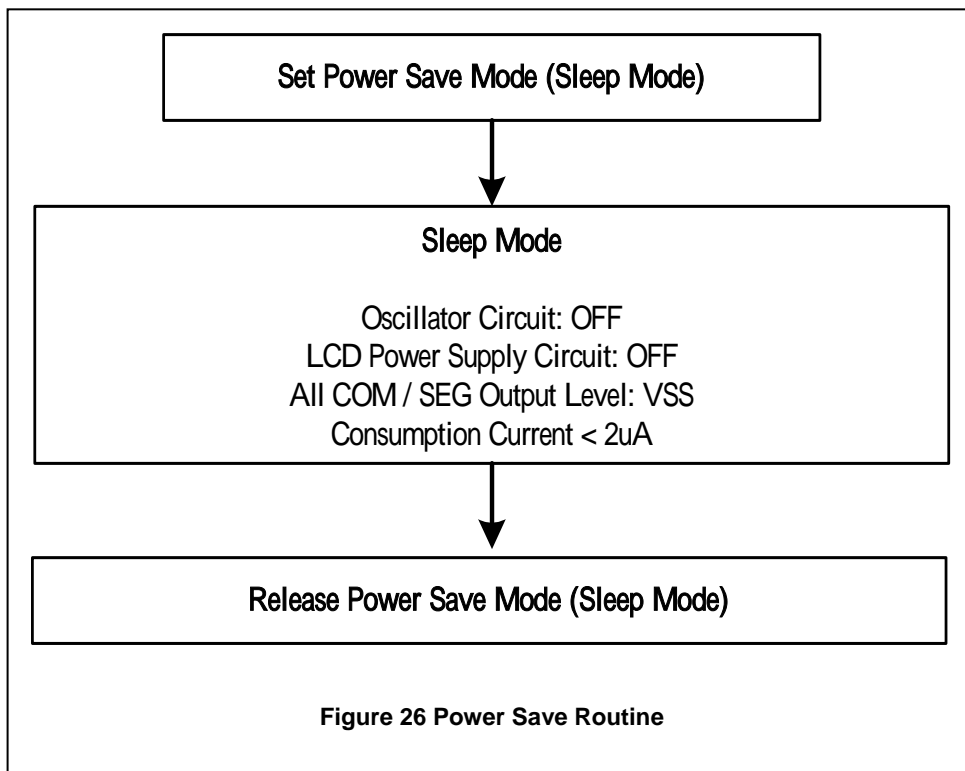

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	1	0	0	P

P = 0: normal mode

P = 1: sleep mode

Release Power Save Mode

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	0	1

Reset

This instruction Resets initial display line, column address, page address, and common output status select to their initial status, but dose not affect the contents of display data RAM. This instruction cannot initialize the LCD power supply, which is initialized by the RESETB pin.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	1	0

Set Data Direction & Display Data Length (3-Line SPI Mode)

Consists of 2 bytes instruction.

This command is used in 3-Line SPI mode only (PS0 = "L" and PS1 = "L"). It will be two continuous commands, the first byte control the data direction(write mode only) and inform the LCD driver the second byte will be number of data bytes will be write. When A0 is not used, the Display Data Length instruction is used to indicate that a specified number of display data bytes are to be transmitted. The next byte after the display data string is handled as command data.

The 1st Instruction: Set Data Direction (Only Write Mode)

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
x	x	1	1	1	0	1	0	0	0

The 2nd Instruction: Set Display Data Length (DDL) Register

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
x	x	D7	D6	D5	D4	D3	D2	D1	D0

D7	D6	D5	D4	D3	D2	D1	D0	Display Data Length
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	1	2
0	0	0	0	0	0	1	0	3
:	:	:	:	:	:	:	:	:
1	1	1	1	1	1	0	1	254
1	1	1	1	1	1	1	0	255
1	1	1	1	1	1	1	1	256

NOP

No operation

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	1	1

Test Instruction

This instruction is for testing IC. Please do not use it.

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	1	x	x	x	x

Set PWM & FRC mode

Selects 3/4 FRC and 45 / 60 PWM

FRC	PWM1	PWM0	Status of PWM & FRC
0			4FRC
1			3FRC
	0	0	45PWM
	0	1	45PWM
	1	0	60PWM
	1	1	---

NOTE: the value of register could not set [PWM1:PWM0]=[1:1]

Set Gray Scale Mode & Register

Consists of 2 bytes instruction. The first byte sets grayscale mode and the second byte updates the contents of gray scale register without issuing any other instruction.

– Set Gray Scale Mode

A0	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	GRAY3	GRAY2	GRAY1	GRAY0	FRAMX1	FRAMX0

GRAY3	GRAY2	GRAY1	GRAY0	FRAMX1	FRAMX0	Description
0	0	0	0	0	0	In case of setting whit mode and 1 st frame
0	0	0	0	0	1	In case of setting whit mode and 2 nd frame

Referential Instruction Setup Flow: Power OFF

Figure 30 Power OFF

LIMITING VALUES

In accordance with the Absolute Maximum Rating System; see notes 1 and 2.

Parameter	Symbol	Conditions	Unit
Power Supply Voltage	VDD1	-0.5 ~ +5.0	V
Power supply voltage	VSS2	1.7 ~ -3.3	V
External Reference Voltage	VEXT	2.0 ~ 3.3	V
Power supply voltage (VDD standard)	VOUT_IN	-0.5 ~ +18	V
Power supply voltage (VDD standard)	V1, V2, V3, V4	0.3 to VOUT_IN	V
Input voltage	VIN	-0.5 to VDD+0.5	V
Output voltage	VO	-0.5 to VDD+0.5	V
Operating temperature	TOPR	-40 to +85	°C
Storage temperature	TSTR	-65 to +150	°C

Notes

1. Stresses above those listed under Limiting Values may cause permanent damage to the device.
2. Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to V_{SS} unless otherwise noted.
3. Insure that the voltage levels of V1, V2, V3, and V4 are always such that

$$V_{OUT_IN} > V_0 > V_1 > V_2 > V_3 > V_4 > V_{SS}$$

DC CHARACTERISTICS

$V_{DD} = 1.7\text{ V to }3.3\text{V}$; $V_{SS} = 0\text{ V}$; $V_{LCD} = 3.0\text{ to }13.0\text{V}$; $T_{amb} = -40\text{ to }+85$; unless otherwise specified.

Item	Symbol	Condition	Rating			Units	Applicable Pin	
			Min.	Typ.	Max.			
Operating Voltage (1)	VDD1		1.7	—	3.3	V	Vss*1	
Operating Voltage (2)	VDD2	(Relative to VSS)	1.7	—	3.3	V	VSS2	
High-level Input Voltage	VIHC		$0.7 \times VDD$	—	VDD	V	*2	
Low-level Input Voltage	VILC		VSS	—	$0.3 \times VDD$	V	*2	
High-level Output Voltage	VOHC		$0.7 \times VDD$	—	VDD	V	*3	
Low-level Output Voltage	VOLC		VSS	—	$0.3 \times VDD$	V	*3	
Input leakage current	ILI	$V_{IN} = VDD\text{ or }VSS$	-1.0	—	1.0	μA	*4	
Output leakage current	ILO	$V_{IN} = VDD\text{ or }VSS$	-3.0	—	3.0	μA	*5	
Liquid Crystal Driver ON Resistance	RON	Ta = 25°C (Relative To VSS)	VOUT_IN = 15.0 V	—	2.0	3.5	K	SEGN COMn *6
			VOUT_IN = 8.0 V	—	3.2	5.4		
Oscillator Frequency	Internal Oscillator	fOSC	1/128 duty Ta = 25°C 9 PWM	—	443.5	462.5	kHz	*7
	External Input	fCL		—	88.7	92.5	kHz	OSC
	Frame frequency	fFRAME		—	77	85	Hz	

Item	Symbol	Condition	Rating			Units	Applicable Pin
			Min.	Typ.	Max.		
Internal Power	Input voltage	VDD (Relative To VSS)	1.7	—	3.3	V	
	Supply Step-up output voltage Circuit	VOUT_OUT (Relative To VSS)	—	—	18	V	VOUT_OUT
	Voltage regulator Circuit Operating Voltage	VOUT_IN (Relative To VSS)	—	—	18	V	VOUT_IN

Dynamic Consumption Current: During Display, with the Internal Power Supply OFF Current consumed by total ICs when an external power supply is used .

Test pattern	Symbol	Condition	Rating			Units	Notes
			Min.	Typ.	Max.		
Display Pattern SNOW	ISS	VDD = 3.0 V, V0 – VSS = 9.0 V	—	1000	2000	μ A	*8
Power Down	ISS	Ta = 25°C	—	0.01	2	μ A	*9

Notes to the DC characteristics

1. The maximum possible V_{OUT} voltage that may be generated is dependent on voltage, temperature and (display) load.
2. Internal clock
3. Power-down mode. During power down all static currents are switched off.
4. If external V_{LCD}, the display load current is not transmitted to I_{DD}.
5. V_{OUT} external voltage applied to VOUT_IN pin; VOUT_IN disconnected from VOUT_OUT

References for items market with *

- *1 While a broad range of operating voltages is guaranteed, performance cannot be guaranteed if there are sudden fluctuations to the voltage while the MPU is being accessed.
- *2 The A0, D0 to D5, D6 (SI), D7 (SCL), /RD (E), /WR ,/(R/W), CSB, IMS, OSC, P/S, /DOF, RESB ,and MODE terminals.
- *3 The D0 to D7, and OSC terminals.
- *4 The A0,/RD (E), /WR ,/(R/W), CSB, IMS, OSC, P/S, /DOF, RESB ,and MODE terminals.
- *5 Applies when the D0 to D5, D6 (SI), D7 (SCL) terminals are in a high impedance state.
- *6 These are the resistance values for when a 0.1 V voltage is applied between the output terminal SEG_n or COM_n and the various power supply terminals (V1, V2, V3, and V4). These are specified for the operating voltage range.
RON = 0.1 V /ΔI (Where ΔI is the current that flows when 0.1 V is applied while the power supply is ON.)
- *7 The relationship between the oscillator frequency and the frame rate frequency.
- *8,9 It indicates the current consumed on LCD panel when the internal oscillator circuit and display are turned on.

tF				—	10	
tR				—	10	

(VDD =1.8V , Ta =25°C)

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Address hold time	A0	tAH6		0	—	ns
Address setup time		tAW6		0	—	
System cycle time		tCYC6		640	—	
Enable L pulse width (WRITE)	WR	tEWLW		360	—	
Enable H pulse width (WRITE)		tEWHW		280	—	
Enable L pulse width (READ)	RD	tEWLR		360	—	
Enable H pulse width (READ)		tEWHR		280	—	
WRITE Data setup time	D0 to D7	tDS6		80	—	
WRITE Data hold time		tDH6		30	—	
READ access time		tACC6	CL = 100 pF	—	240	
READ Output disable time		tOH6	CL = 100 pF	10	200	
tF				—	10	
tR				—	10	

*1 The input signal rise time and fall time (tr, tf) is specified at 15 ns or less. When the system cycle time is extremely fast, (tr +tf) (tCYC6 – tEWLW – tEWHW) for (tr + tf) (tCYC6 – tEWLR – tEWHR) are specified.

*2 All timing is specified using 20% and 80% of VDD as the reference.

*3 tEWLW and tEWLR are specified as the overlap between CSB being “L” and E.

SERIAL INTERFACE (4-Line Interface)

Figure 32

($V_{DD}=3.3V, T_a=25^\circ C$)

Reset "L" pulse width	RESB	tRW		1.5	—	—	us

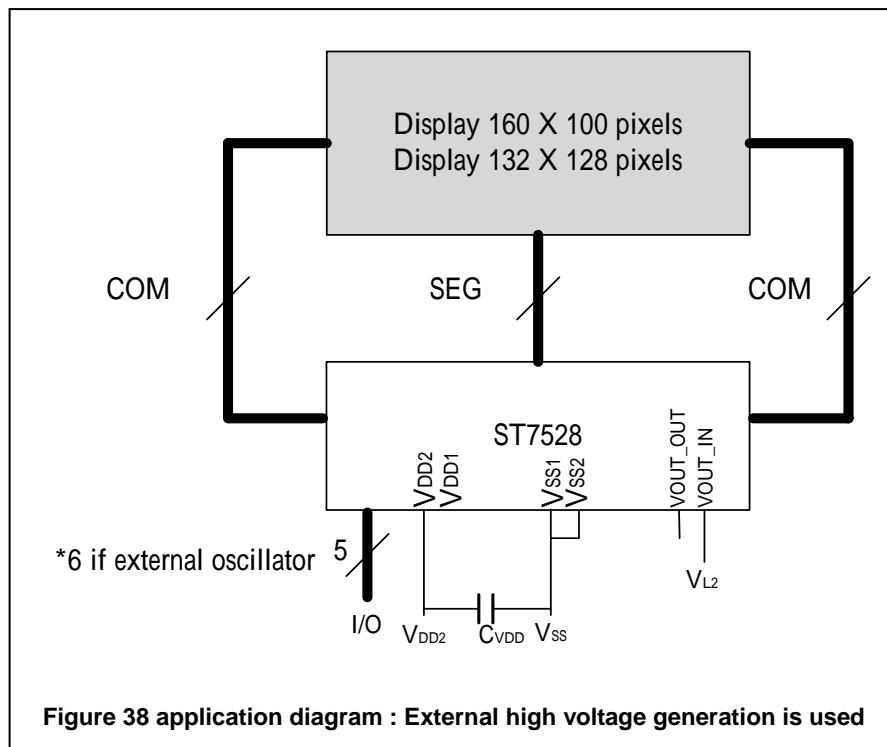

(VDD = 1.8V , Ta = -40 to 85°C)

Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		tR		—	—	2.0	us
Reset "L" pulse width	RESB	tRW		2.0	—	—	us

POWER PAD CONNECT

The pinning of the ST7528 is optimized for single plane wiring e.g. for chip-on-glass display modules. Display size: 160 X 100 pixels or 132 X 128 pixels.

The required minimum value for the external capacitors in an application with the ST7528 are:

$$C_{V_{LCD}} = \text{min. } 100\text{nF} \quad C_{V_{DD1,2}} = \text{min. } 1.0 \mu\text{F}$$

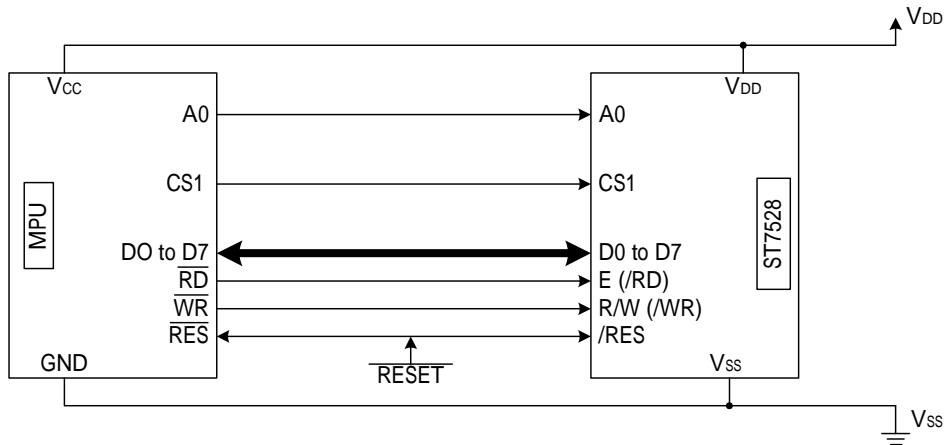

Higher capacitor values are recommended for ripple reduction.

THE MPU INTERFACE (REFERENCE EXAMPLES)

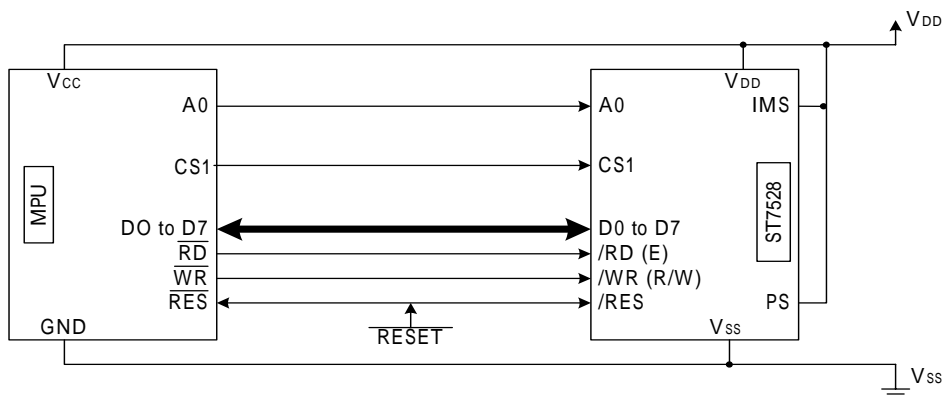

The ST7528 Series can be connected to either 60X86 Series MPUs or to 6800 Series MPUs. Moreover, using the serial interface it is possible to operate the ST7528 series chips with fewer signal lines.

The display area can be enlarged by using multiple ST7528 Series chips. When this is done, the chip select signal can be used to select the individual ICs to access.

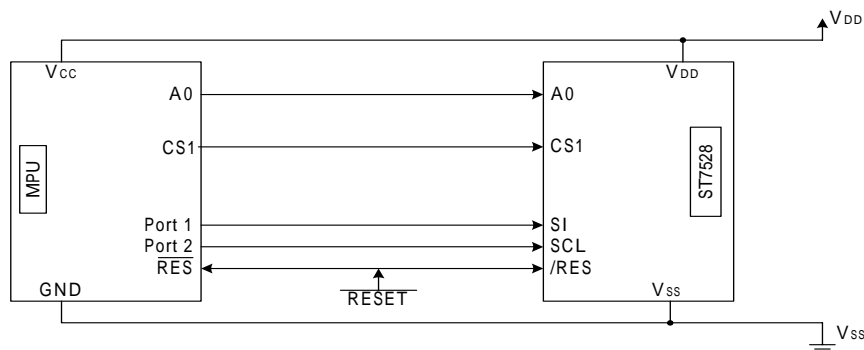

(1) 8080 Series MPUs

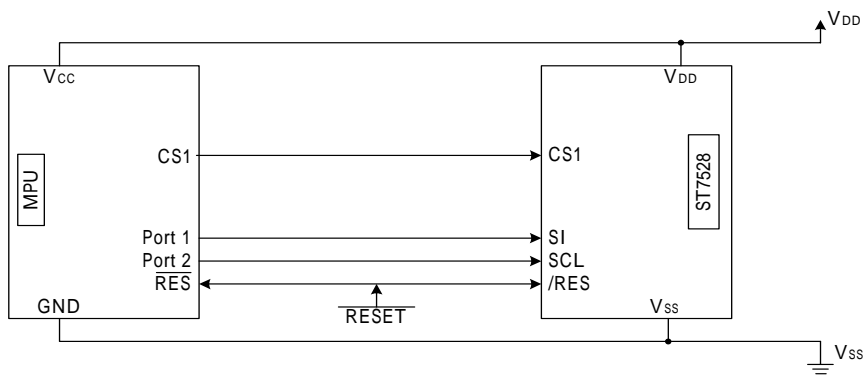

(2) 6800 Series MPUs

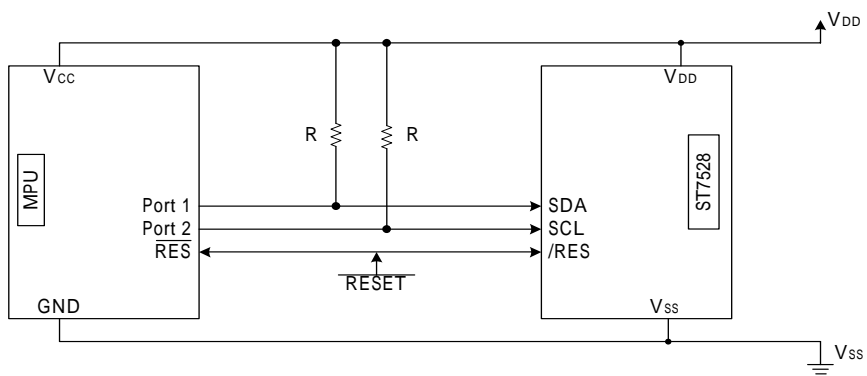

(3) Using the Serial Interface (4-line interface)

(4) Using the Serial Interface (3-line interface)

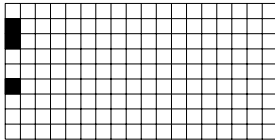

(5) Using the Serial Interface (IIC interface)

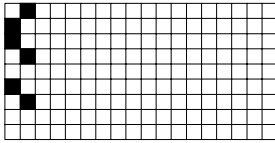

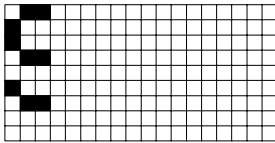

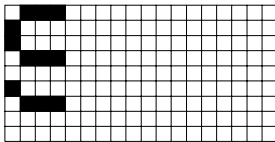

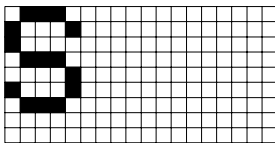

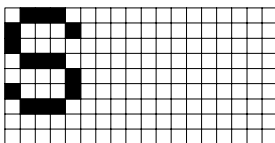

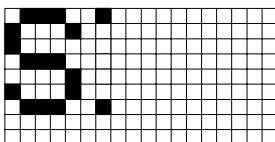

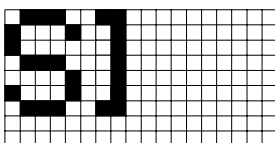

APPLICATION Program Example

VEXT:OPEN
T0~T9:OPEN
MF[2:0]:VDD OR VSS=(0,0,0)
DS[1:0]:VDD OR VSS=(0,0)
(MF[2:0]&DS[1:0] is ID of this IC, these pins cannot be left open)
C=1uF

ST7528

ST7528

Internal analog circuit

Mode1: Resolution : $101(100\text{COM}+\text{ICOM}) * 160(\text{SEG})$

Interface : 8080 interface

OSC1:External for input

External VOUT from VOUT_IN

(the same pin should be connected together,
for example, pin246(D0) connect to pin247(D0)
exclude power pin)

PS0:VDD

PS1:VSS

PS2:VSS

Mode:VDD

TA:VDD

C=1uF

Change History

- 1.5V 2004/6/29 80,68,IIC Timing character definition
- 1.6V 2004/7/21 Modify Application Note VDD, VSS routing
- 1.7V 2004/10/12 Add Timing parameter , tF and tR
- 1.8V 2004/11/26 Modify Vout Max limitation from 15V to 18V
Add VEXT using range (2.0V~3.3V)
