## 81 COM / 128 SEG DRIVER & CONTROLLER FOR STN LCD

March 2001

Ver. 2.1

Contents in this document are subject to change without notice. No part of this document may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose, without the express written permission of LCD Driver IC Team.

### **Precautions for Light**

Light has characteristics to move electrons in the integrated circuitry of semiconductors, therefore may change the characteristics of semiconductor devices when irradiated with light. Consequently, the users of the packages which may expose chips to external light such as COB, COG, TCP and COF must consider effective methods to block out light from reaching the IC on all parts of the surface area, the top, bottom and the sides of the chip. Follow the precautions below when using the products.

1. Consider and verify the protection of penetrating light to the IC at substrate (board or glass) or product design stage.
2. Always test and inspect products under the environment with no penetration of light.

<b>S6B0759 Specification Revision History</b>		
<b>Version</b>	<b>Content</b>	<b>Date</b>
0.0	Original	July.1999
0.1	Remove HPMB,CS2 Pin and Change Vol, Voh value	July.1999
0.2	Modify Pad Dimensions and Chip Configuration	Aug. 1999
0.3	Modify serial/parallel timing requirements ;added icon enable/disable function	Dec. 1999
1.0		Jan. 2000
1.1	Modify 6800 parallel interface timing	Feb 2000
1.2	Add the programming guide-lines comment for n-line inversion	Mar 2000
1.3	Modify dynamic current consumption value(Idd2) and sleep mode current value(Idds1)	June 2000
2.0	Modify Temperature Coefficient(-0.05% to -0.075%)	Aug 2000
2.1	Added detail information for several items	Mar.2001

## INTRODUCTION

The S6B0759 is a driver and controller LSI for graphic dot-matrix liquid crystal display systems. It contains 81 common and 128 segment driver circuits. This chip is connected directly to a microprocessor, accepts serial or 8-bit parallel display data and stores in an on-chip display data RAM of  $81 \times 128$  bits. It provides a highly flexible display section due to 1-to-1 correspondence between on-chip display data RAM bits and LCD panel pixels. And it performs display data RAM read/write operation with no externally operating clock to minimize power consumption. In addition, because it contains power supply circuits necessary to drive liquid crystal, it is possible to make a display system with the fewest components.

## FEATURES

### Driver Output Circuits

- 81 common outputs, 128 segment outputs

### Applicable Duty Ratios

Programmable duty ratio	Applicable LCD bias	Maximum display area
1/17 to 1/81	1/4 to 1/11	$81 \times 128$

- Various partial display
- Partial window moving and data scrolling

### On-chip Display Data RAM

- Capacity:  $81 \times 128 = 10,368$  bits
- Bit data "1": a dot of display is illuminated.
- Bit data "0": a dot of display is not illuminated.

### Microprocessor Interface

- 8-bit parallel bi-directional interface with 6800-series or 8080-series.
- SPI (Serial Peripheral Interface) available. (only write operation)

### On-chip Low Power Analog Circuit

- On-chip oscillator circuit
- Voltage converter ( $\times 3$ ,  $\times 4$ ,  $\times 5$  or  $\times 6$ )
- Voltage regulator (temperature coefficient:  $-0.075\%/^{\circ}\text{C}$  or external input)
- On-chip electronic contrast control function (64 steps)
- Voltage follower (LCD bias: 1/4 to 1/11)

### Operating Voltage Range

- Supply voltage ( $V_{\text{DD}}$ ): 1.8 to 3.3 V
- LCD driving voltage ( $V_{\text{LCD}} = V_0 - V_{\text{SS}}$ ): 4.0 to 15.0 V

### Low power Consumption

- TBD  $\mu\text{A}$  Typ. (Internal power supply on and display OFF)

### Package Type

- Gold bumped chip or TCP

**PAD CONFIGURATION**

**Figure 2. S6B0759 Chip Configuration**

**Table 1. S6B0759 Pad Dimension**

Item	Pad No.		Size		Unit
			X	Y	
Chip Size	-		9980	2380	um
Pad Pitch	Input	1 to 123	70		
	Output	125 to 152	60		
		157 to 310			
		315 to 342			
	NC	124,343	70		
		154,155,312,313	80		
		153,156,311,314	70/80		
Bumped Pad Size(Max.)	1 to 123		50	100	
	124		110	60	
	125 to 152		110	40	
	153 to 154		110	60	
	155 to 156		60	110	
	157 to 310		40	110	
	311 to 312		60	110	
	313 to 314		110	60	
	315 to 342		110	40	
	343		110	60	
Bumped Pad Height	All Pad		14(Typ.)		

**NOTE:** Dummy to Dummy pad pitch is 80 um. Dummy to normal pad pitch is 70 um.

**COG Align Key Coordinate**

**ILB Align Key Coordinate(with Gold Bump\*)**

\* When designing electrode pattern must be prohibited on this area (ILB Align Key). If electrode pattern is used for routing over this area, it can be happened pattern-short through bumped pattern on ILB Align Key.

## LCD DRIVER SUPPLY

Table 4. LCD Driver Supply Pins

Name	I/O	Description
C1-	O	Capacitor 1 negative connection pin for voltage converter
C1+	O	Capacitor 1 positive connection pin for voltage converter
C2-	O	Capacitor 2 negative connection pin for voltage converter
C2+	O	Capacitor 2 positive connection pin for voltage converter
C3+	O	Capacitor 3 positive connection pin for voltage converter
C4+	O	Capacitor 4 positive connection pin for voltage converter
C5+	O	Capacitor 5 positive connection pin for voltage converter
VOUT	I/O	Voltage converter input/output pin
VCI	I	Voltage converter input voltage pin
VR	I	V0 voltage adjustment pin It is valid only when on-chip resistors are not used (INTRS = "L")
REF	I	Selects the external VREF voltage via VEXT pin – REF = "L": using the external VREF – REF = "H": using the internal VREF
VEXT	I	Externally input reference voltage (VREF) for the internal voltage regulator It is valid only when REF is "L".

## SYSTEM CONTROL

Table 5. System Control Pins

Name	I/O	Description
INTRS	I	Internal resistors select pin. This pin selects the resistors for adjusting V0 voltage level. – INTRS = "H": use the internal resistors – INTRS = "L": use the external resistors VR pin and external resistive divider control V0 voltage.
TEST1 to TEST4	I	Test pins Don't use these pins.

## MICROPROCESSOR INTERFACE

Table 6. Microprocessor Interface Pins

Name	I/O	Description					
RESETB	I	Reset the input pin When RESETB is "L", initialization is executed.					
PS0	I	Parallel/Serial data input select input					
		PS0	Interface Mode	Data/Instruction	Data	Read/Write	Serial Clock
		H	Parallel	RS	DB0 to DB7	E_RD RW_WR	-
		L	Serial	RS or None	SID(DB7)	Write only	SCLK(DB6)
<b>NOTE:</b> When PS is "L", DB0 to DB5 are high impedance and E_RD and RW_WR must be fixed to either "H" or "L".							
PS1	I	Microprocessor interface select input pin <ul style="list-style-type: none"> <li>- PS0 = "H" , PS1 = "H": 6800-series parallel MPU interface</li> <li>- PS0 = "H" , PS1 = "L": 8080-series parallel MPU interface</li> <li>- PS0 = "L" , PS1 = "H": 4 Pin-SPI serial MPU interface</li> <li>- PS0 = "L" , PS1 = "L": 3 Pin-SPI serial MPU interface</li> </ul>					
CS1B	I	Chip select input pins Data/instruction I/O is enabled only when CS1B is "L" . When chip select is non-active, DB0 to DB7 may be high impedance.					
RS	I	Register select input pin <ul style="list-style-type: none"> <li>- RS = "H": DB0 to DB7 are display data</li> <li>- RS = "L": DB0 to DB7 are control data</li> </ul>					
RW_WR	I	Read/Write execution control pin					
		PS1	MPU Type	RW_WR	Description		
		H	6800-series	RW	Read/Write control input pin <ul style="list-style-type: none"> <li>- RW = "H": read</li> <li>- RW = "L": write</li> </ul>		
L	8080-series	/WR	Write enable clock input pin The data on DB0 to DB7 are latched at the rising edge of the /WR signal.				

Table 6. Microprocessor Interface Pins (Continued)

Name	I/O	Description			
E_RD	I	Read/Write execution control pin			
		PS1	MPU Type	E_RD	Description
		H	6800-series	E	Read/Write control input pin – RW = "H": When E is "H", DB0 to DB7 are in an output status. – RW = "L": The data on DB0 to DB7 are latched at the falling edge of the E signal.
		L	8080-series	/RD	Read enable clock input pin When /RD is "L", DB0 to DB7 are in an output status.
DB0 to DB7	I/O	8-bit bi-directional data bus that is connected to the standard 8-bit microprocessor data bus. When the serial interface selected (PS0 = "L"); – DB0 to DB5: high impedance – DB6: serial input clock (SCLK) – DB7: serial input data (SID) When chip select is not active, DB0 to DB7 may be high impedance.			
TEST1 to TEST4	I/O	These test pins should be opened.			

## LCD DRIVER OUTPUTS

Table 7. LCD Driver Outputs Pins

Name	I/O	Description			
SEG0 to SEG127	O	LCD segment driver outputs The display data and the M signal control the output voltage of segment driver.			
		Display data	M (Internal)	Segment driver output voltage	
				Normal display	Reverse display
		H	H	V0	V2
		H	L	V <sub>SS</sub>	V3
		L	H	V2	V0
		L	L	V3	V <sub>SS</sub>
		Power save mode		V <sub>SS</sub>	V <sub>SS</sub>
COM0 to COM79	O	LCD common driver outputs The internal scanning data and M signal control the output voltage of common driver.			
		Scan data	M (Internal)	Common driver output voltage	
		H	H	V <sub>SS</sub>	
		H	L	V0	
		L	H	V1	
		L	L	V4	
		Power save mode		V <sub>SS</sub>	
COMS (COMS1)	O	Common output for the icons. The output signals of two pins are same. When not used, these pins should be left open.			

**NOTE:** DUMMY —These pins should be opened (floated).

## FUNCTIONAL DESCRIPTION

### MICROPROCESSOR INTERFACE

#### Chip Select Input

There are CS1B for chip selection. The S6B0759 can interface with an MPU only when CS1B is "L". When these pins are set to any other combination, RS, E\_RD, and RW\_WR inputs are disabled and DB0 to DB7 are to be high impedance. And, in case of serial interface, the internal shift register and the counter are reset.

#### Parallel/Serial Interface

S6B0759 has four types of interface with an MPU, which are two serial and two parallel interface. This parallel or serial interface is determined by PS 0pin as shown in Table 8.

**Table 8. Parallel/Serial Interface Mode**

PS0	Type	CS1B	PS1	Interface mode
H	Parallel	CS1B	H	6800-series MPU mode
			L	8080-series MPU mode
L	Serial	CS1B	H	4 Pin-SPI MPU mode
			L	3 Pin-SPI MPU mode

#### Parallel Interface (PS0 = "H")

The 8-bit bi-directional data bus is used in parallel interface and the type of MPU is selected by PS1 as shown in Table 9. The type of data transfer is determined by signals at RS, E\_RD and RW\_WR as shown in Table 10.

**Table 9. Microprocessor Selection for Parallel Interface**

PS1	CS1B	RS	E_RD	RW_WR	DB0 to DB7	MPU bus
H	CS1B	RS	E	RW	DB0 to DB7	6800-series
L	CS1B	RS	/RD	/WR	DB0 to DB7	8080-series

**Table 10. Parallel Data Transfer**

Common	6800-series		8080-series		Description
	E_RD (E)	RW_WR (RW)	E_RD (/RD)	RW_WR (/WR)	
RS					
H	H	H	L	H	Display data read out
H	H	L	H	L	Display data write
L	H	H	L	H	Register status read
L	H	L	H	L	Writes to internal register (instruction)

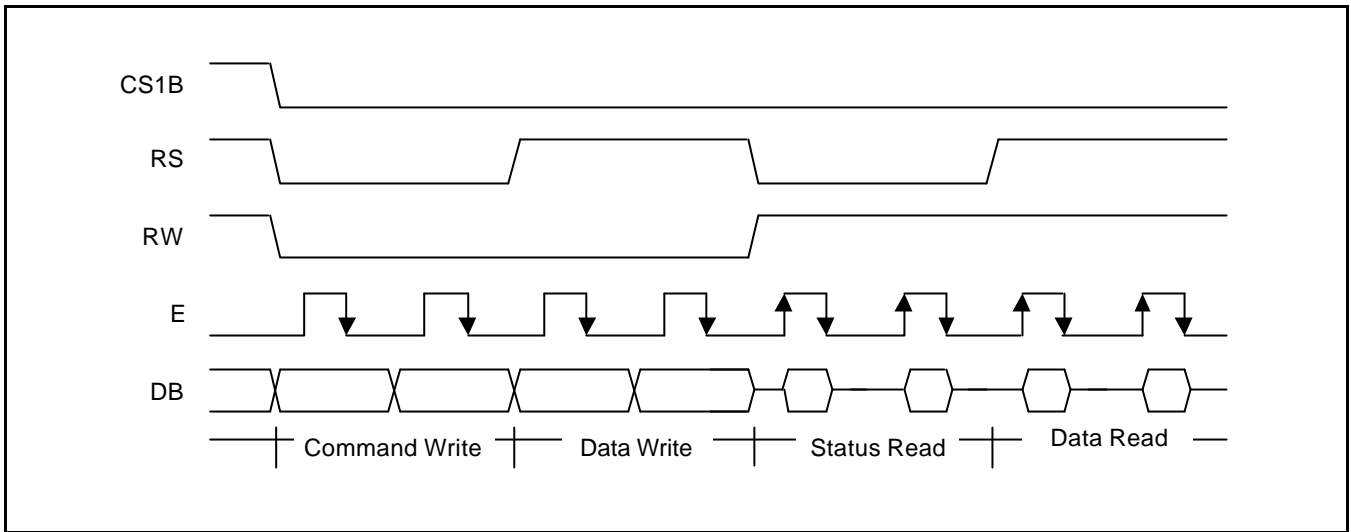

Figure 3. 6800-Series MPU Interface protocol (PS0="H", PS1="H")

Figure 4. 8080-Series MPU Interface Protocol (PS0="H", PS1="L")

**Serial Interface (PS0 = "L")**

When the S6B0759 is active(CS1B="L"), serial data (DB7) and serial clock (DB6) inputs are enabled. And not active, the internal 8-bit shift register and the 3-bit counter are reset. The display data/command indication may be controlled either via software or the Register Select(RS) Pin, based on the setting of PS1. When the RS pin is used (PS1 = "H"), data is display data when RS is high, and command data when RS is low. When RS is not used (PS1 = "L"), the LCD Driver will receive command from MPU by default. If messages on the data pin are data rather than command, MPU should send Data Direction command(11101000) to control the data direction and then one more command to define the number of data bytes will be write. After these two continuous commands are send, the following messages will be data rather than command. Serial data can be read on the rising edge of serial clock going into DB6 and processed as 8-bit parallel data on the eighth serial clock. And the DDRAM column address pointer will be increased by one automatically. The next bytes after the display data string is handled as command data.

Serial Mode	PS0	PS1	CS1B	RS
Serial-mode with RS pin	L	H	CS1B	Used
Serial-mode with software command	L	L	CS1B	Not used

**4 Pin-SPI Interface (PS0 = "L" , PS1 = "H")**

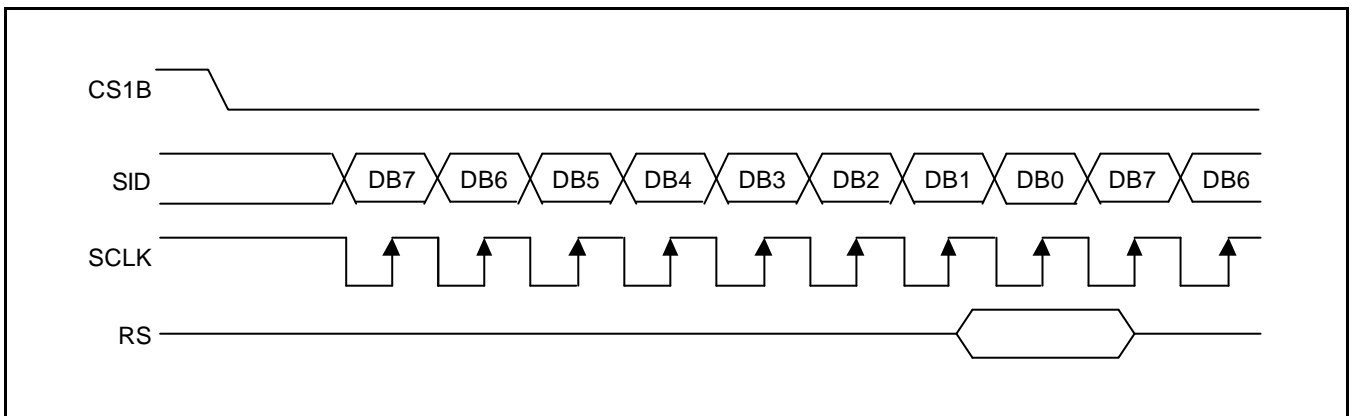

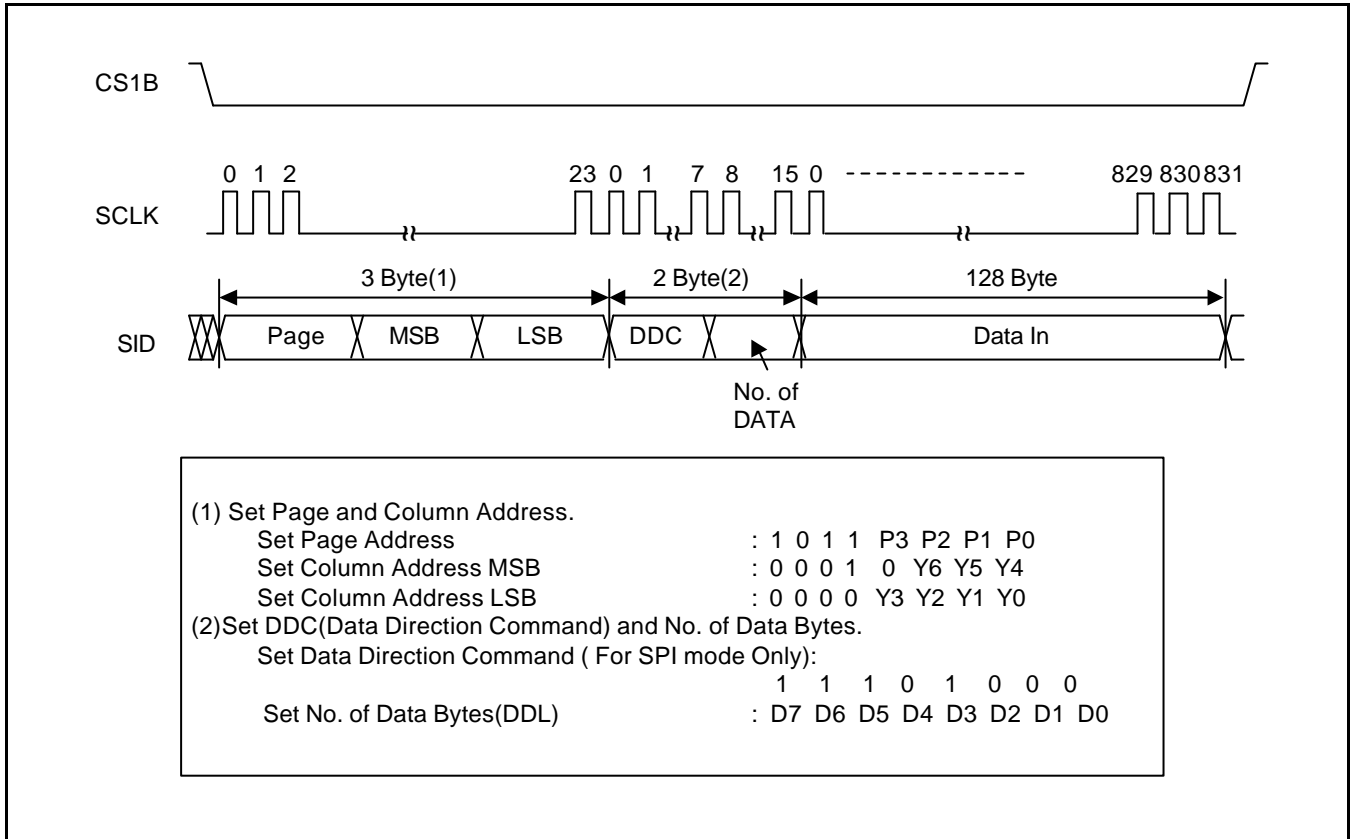

Figure 5. 4-Pin SPI Timing (RS is used)

**3 Pin-SPI Interface (PS0 = "L", PS1 = "L")**

To write data to the DDRAM, send Data Direction Command in 3-Pin SPI mode. Data is latched at the rising edge of SCLK. And the DDRAM column address pointer will be increased by one automatically.

**Figure 6. 3-Pin SPI Timing (RS is not used)**

This command is used in 3-Pin SPI mode only. It will be two continuous commands, the first byte controls the data direction and informs the LCD driver the second byte will be number of data bytes will be write. After these two commands sending out, the following messages will be data. If data is stopped in transmitting, it is not valid data. New data will be transferred serially with most significant bit first.

**NOTES:**

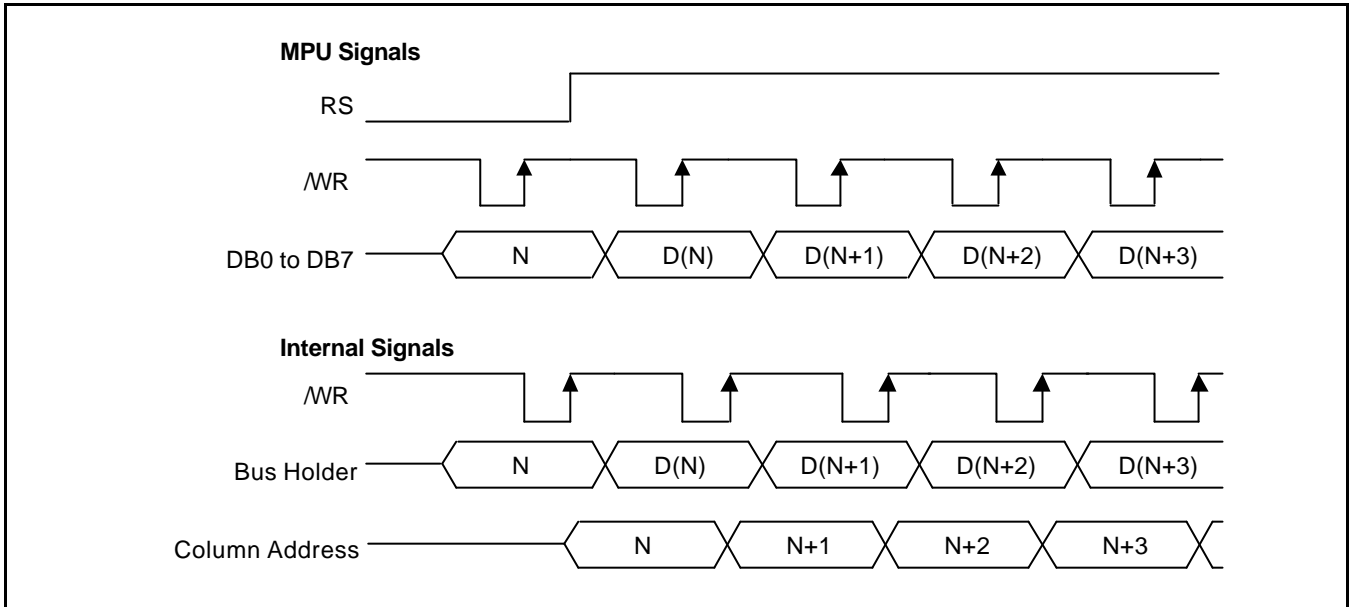

1. In spite of transmission of data, if CS1B will be disable, state terminates abnormally. Next state is initialized.
2. DDL Register value "0" → "1", "127" → "128". (decimal value)

**Busy Flag**

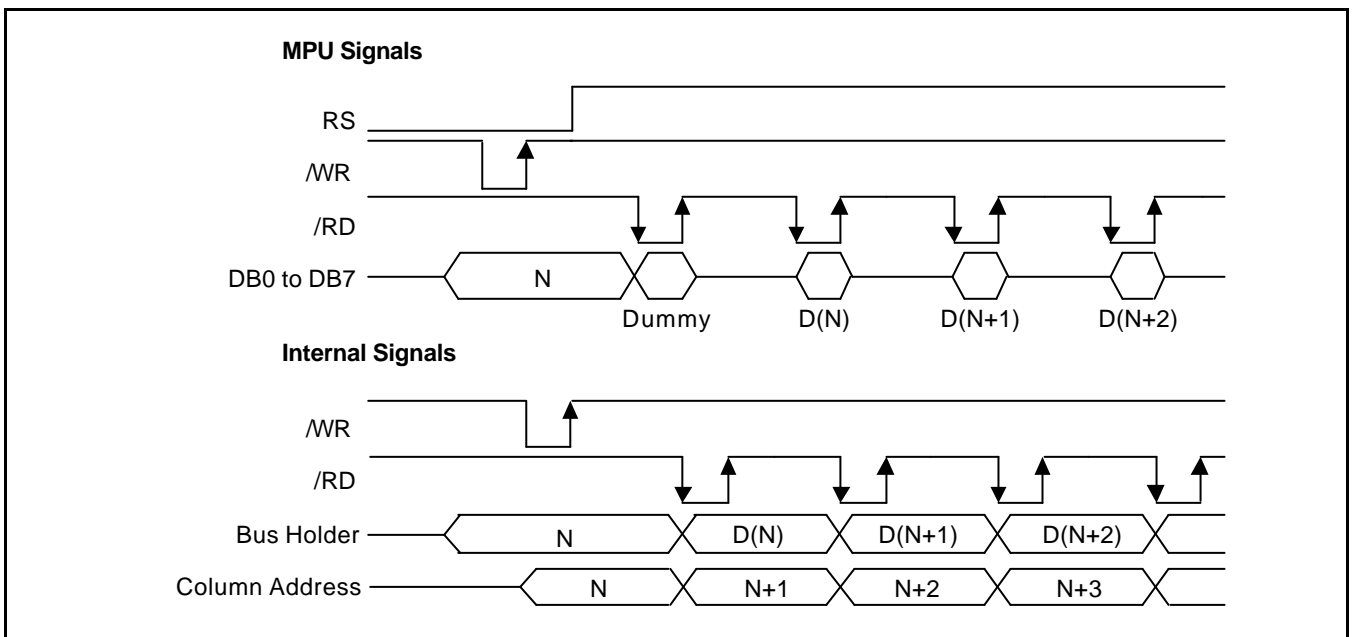

The Busy Flag indicates whether the S6B0759 is operating or not. When DB7 is "H" in read status operation, this device is in busy status and will accept only read status instruction. If the cycle time is correct, the microprocessor needs not to check this flag before each instruction, which improves the MPU performance.

**Data Transfer**

The S6B0759 uses bus holder and internal data bus for Data Transfer with the MPU. When writing data from the MPU to on-chip RAM, data is automatically transferred from the bus holder to the RAM as shown in Figure 7. And when reading data from on-chip RAM to the MPU, the data for the initial read cycle is stored in the bus holder (dummy read) and the MPU reads this stored data from bus holder for the next data read cycle as shown in Figure 8. This means that a dummy read cycle must be inserted between each pair of address sets when a sequence of address sets is executed. Therefore, the data of the specified address cannot be output with the read display data instruction right after the address sets, but can be output at the second read of data.

**Figure 7. Write Timing**

**Figure 8. Read Timing**

## DISPLAY DATA RAM (DDRAM)

The Display Data RAM stores pixel data for the LCD. It is 81-row by 128-column addressable array. Each pixel can be selected when the page and column addresses are specified. The 81 rows are divided into 10 pages of 8 lines and the 11th page with a single line (DB0 only). Data is read from or written to the 8 lines of each page directly through DB0 to DB7. The display data of DB0 to DB7 from the microprocessor correspond to the LCD common lines as shown in Figure 9. The microprocessor can read from and write to RAM through the I/O buffer. Since the LCD controller operates independently, data can be written into RAM at the same time as data is being displayed without causing the LCD flicker.

**Figure 9. RAM-to-LCD Data Transfer**

### Page Address Circuit

This circuit is for providing a Page Address to Display Data RAM shown in Figure 11. It incorporates 4-bit Page Address register changed by only the "Set Page" instruction. Page Address 10 (DB3 and DB 1 are "H", DB2 and DB0 is "L") is a special RAM area for the icons and display data DB0 is only valid.

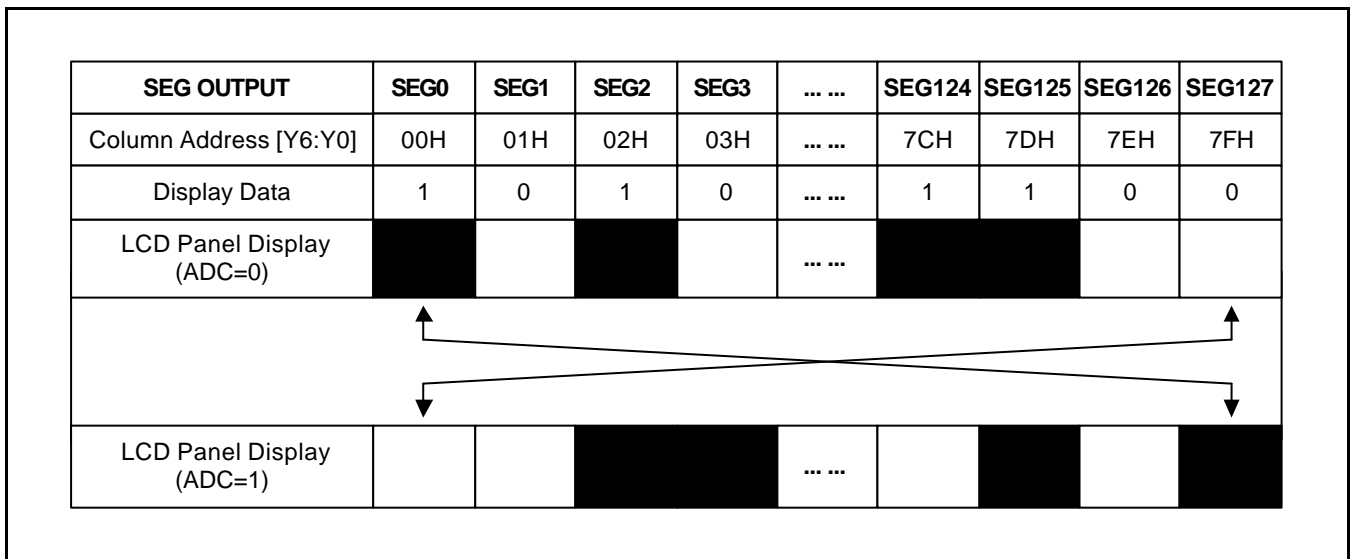

### Line Address Circuit

This circuit assigns DDRAM a Line Address corresponding to the first line (COM0) of the display. Therefore, by setting line address repeatedly, it is possible to realize the screen scrolling and page switching without changing the contents of on-chip RAM as shown in Figure 11 & Figure 12. It incorporates 7-bit Line Address register changed by only the initial display line instruction and 7-bit counter circuit. At the beginning of each LCD frame, the contents of register are copied to the line counter which is increased by CL signal and generates the Line Address for transferring the 128-bit RAM data to the display data latch circuit. However, display data of icons are not scrolled because the MPU can not access Line Address of icons.

**Column Address Circuit**

Column address circuit has a 7-bit preset counter that provides column address to the Display Data RAM as shown in Figure 11. When set Column Address MSB/LSB instruction is issued, 7-bit [Y6:Y0] is updated. And, since this address is increased by 1 each a read or write data instruction, microprocessor can access the display data continuously. And the Column Address counter is independent of page address register.

ADC Select instruction makes it possible to invert the relationship between the column address and the segment outputs. It is necessary to rewrite the display data on built-in RAM after issuing ADC Select instruction. Refer to the following Figure 10.

**Figure 10. The Relationship between the Column Address and the Segment Outputs**

**Segment Control Circuit**

This circuit controls the display data by the Display ON/OFF, reverse display ON/OFF and entire display ON/OFF instructions without changing the data in the display data RAM.

Figure 11. Display Data RAM Map (Initial Line Address = 00H)

Figure 12. Display Data RAM Map (Initial Line Address = 08H)

## LCD DISPLAY CIRCUITS

### Oscillator

This is completely on-chip Oscillator and its frequency is nearly independent of VDD. This Oscillator signal is used in the voltage converter and display timing generation circuit.

### Display Timing Generator Circuit

This circuit generates some signals to be used for displaying LCD. The display clock, CL(internal), generated by oscillation clock, generates the clock for the line counter and the signal for the display data latch. The line address of on-chip RAM is generated in synchronization with the display clock and the display data latch circuit latches the 128-bit display data in synchronization with the display clock. The display data, which is read to the LCD driver, is completely independent of the access to the display data RAM from the microprocessor. The display clock generates an LCD AC signal (M) which enables the LCD driver to make a AC drive waveform, and also generates an internal common timing signal and start signal to the common driver. The frame signal or the line signal changes the M by setting internal instruction. Driving waveform and internal timing signal are shown in Figure 13.

Figure 13. 2-frame AC Driving Waveform (Duty Ratio = 1/81)

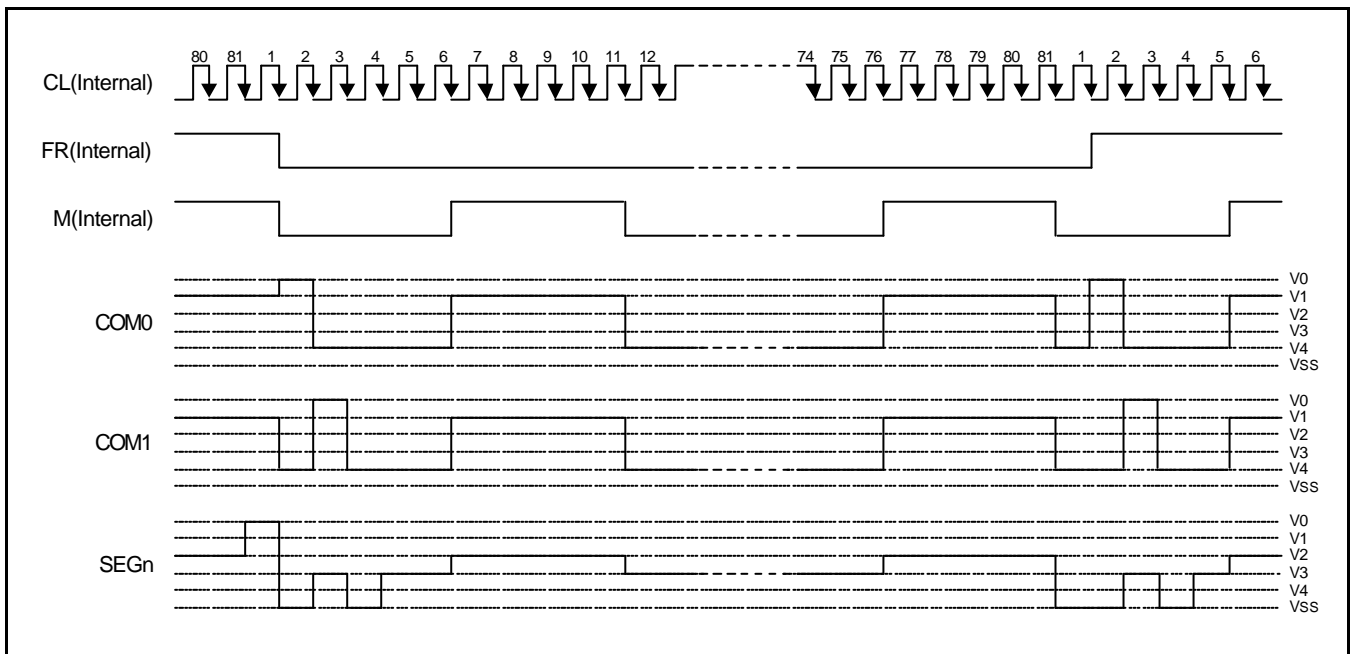

Figure 14. N-line Inversion Driving Waveform (N = 5 , Duty Ratio = 1/81)

LCD DRIVER CIRCUIT

81-channel common driver and 128-channel segment driver configure this driver circuit. This LCD panel driver voltage depends on the combination of display data and M(internal) signal.

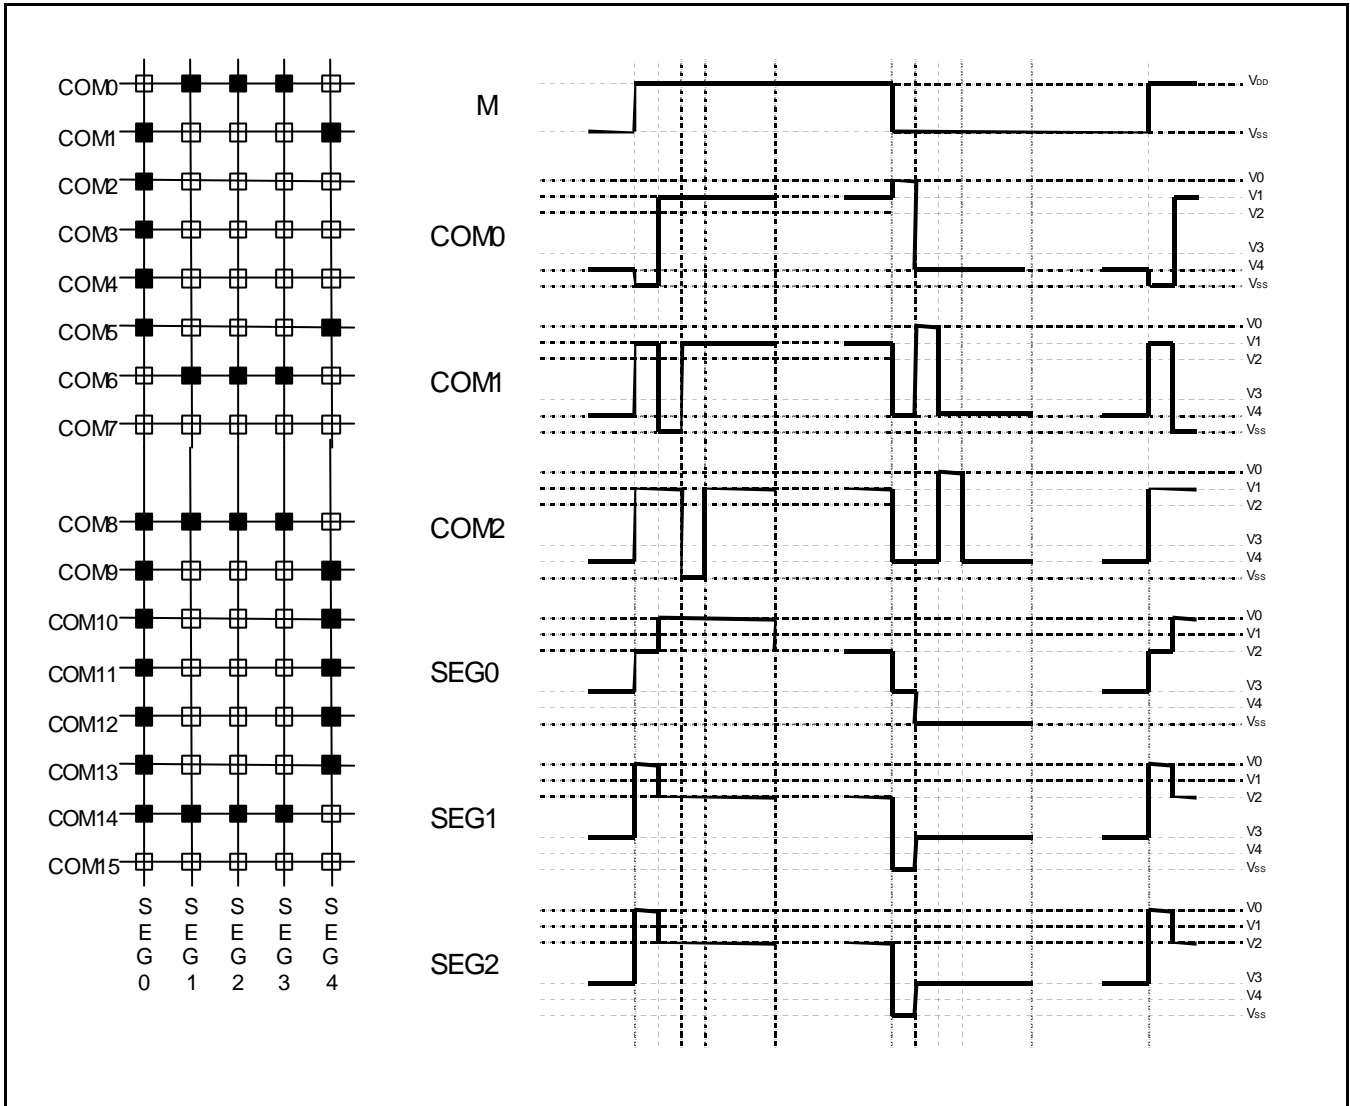

Figure 15. Segment and Common Timing

**Partial Display on LCD**

The S6B0759 realizes the Partial Display function on LCD with low-duty driving for saving power consumption and showing the various display duty. To show the various display duty on LCD, LCD driving duty and bias are programmable via the instruction. And, built-in power supply circuits are controlled by the instruction for adjusting the LCD driving voltages

**Figure 16. Reference Example for Partial Display (Display Duty = 25)**

**Figure 17. Partial Display (Partial Display Duty = 17, Initial COM0 = 0)**

Figure 18. Moving Display (Partial Display Duty = 17, Initial COM0 = 8)

## POWER SUPPLY CIRCUITS

The Power Supply Circuits generate the voltage levels necessary to drive liquid crystal driver circuits with low-power consumption and the fewest components. There are voltage converter circuits, voltage regulator circuits, and voltage follower circuits. They are valid only in master operation and controlled by power control instruction. For details, refers to "Instruction Description". Table 11 shows the referenced combinations in using Power Supply circuits.

Table 11. Recommended Power Supply Combinations

User setup	Power control (VC VR VF)	V/C circuits	V/R circuits	V/F circuits	VOUT	V0	V1 to V4
Only the internal power supply circuits are used.	1 1 1	ON	ON	ON	Open	Open	Open
Only the voltage regulator circuits and voltage follower circuits are used.	0 1 1	OFF	ON	ON	External input	Open	Open
Only the voltage follower circuits are used.	0 0 1	OFF	OFF	ON	Open	External input	Open
Only the external power supply circuits are used.	0 0 0	OFF	OFF	OFF	Open	External input	External input

**Voltage Converter Circuits**

These circuits boost up the electric potential between  $V_{CI}$  and  $V_{SS}$  to 3, 4, 5 or 6 times toward positive side and boosted voltage is outputted from  $V_{OUT}$  pin. It is possible to select the lower boosting level in any boosting circuit by "Set DC-DC Step-up" instruction. When the higher level is selected by instruction,  $V_{OUT}$  voltage is not valid.

[C1 = 1.0 to 4.7  $\mu$ F]

**Figure 19. Three Times Boosting Circuit**

**Figure 20. Four Times Boosting Circuit**

**Figure 21. Five Times Boosting Circuit**

**Figure 22. Six Times Boosting Circuit**

**Voltage Regulator Circuits**

The function of the internal Voltage Regulator circuits is to determine liquid crystal operating voltage, V<sub>0</sub>, by adjusting resistors, R<sub>a</sub> and R<sub>b</sub>, within the range of |V<sub>0</sub>| < |V<sub>OUT</sub>|. Because V<sub>OUT</sub> is the operating voltage of operational-amplifier circuits shown in Figure , it is necessary to be applied internally or externally.

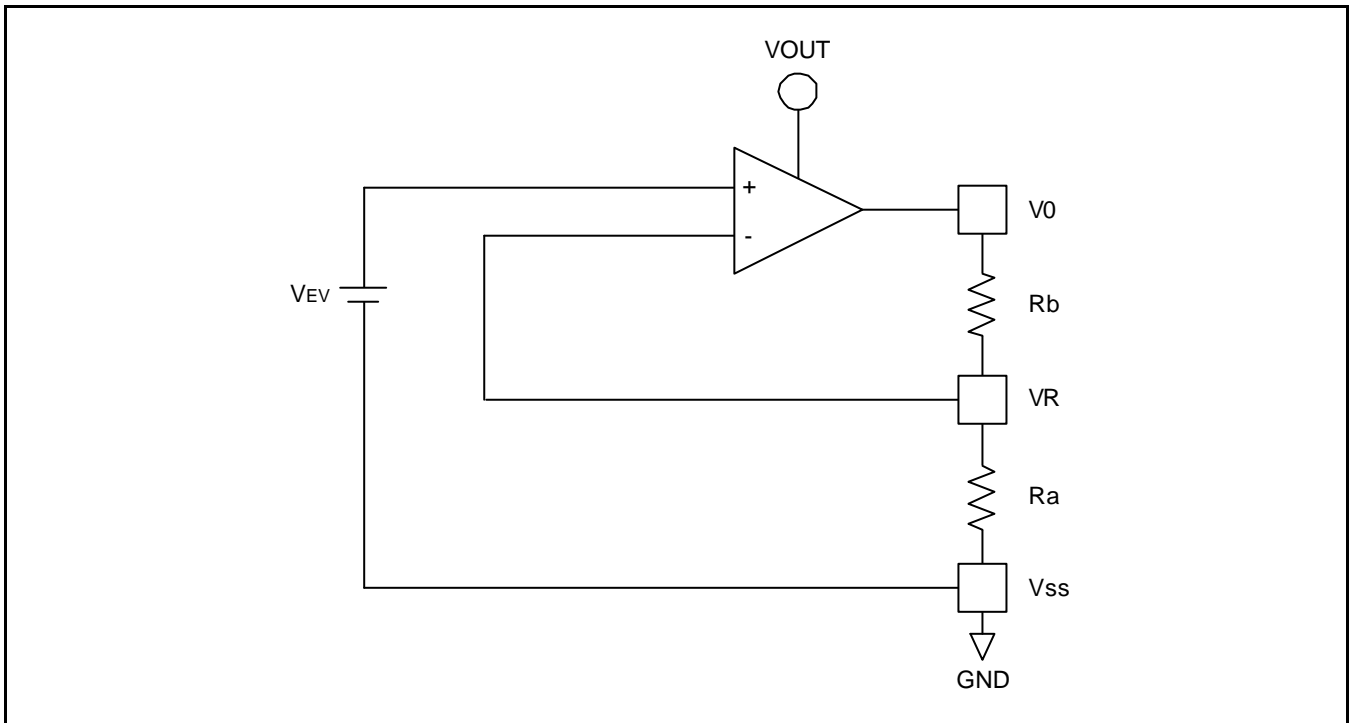

For the Eq. 1, we determine V<sub>0</sub> by R<sub>a</sub>, R<sub>b</sub> and V<sub>EV</sub>. The R<sub>a</sub> and R<sub>b</sub> are connected internally or externally by INTRS pin. And V<sub>EV</sub> called the voltage of electronic volume is determined by Eq. 2, where the parameter α is the value selected by instruction, "Set Reference Voltage Register", within the range 0 to 63. V<sub>REF</sub> voltage at T<sub>a</sub>= 25°C is shown in Table .

$$V_0 = \left(1 + \frac{R_b}{R_a}\right) \times V_{EV} \text{ [V]} \text{ ----- (Eq.1)}$$

$$V_{EV} = \left(1 - \frac{(63 - \alpha)}{210}\right) \times V_{REF} \text{ [V]} \text{ ----- (Eq.2)}$$

**Table 12. V<sub>REF</sub> Voltage at T<sub>a</sub> = 25°C**

REF	Temp. coefficient	V <sub>REF</sub> [ V ]
1	-0.075%/°C	2.1
0	External input	V <sub>EXT</sub>

**Figure 23. Internal Voltage Regulator Circuit**

**In Case of Using Internal Resistors, Ra and Rb (INTRS = "H")**

When INTRS pin is "H", resistor Ra is connected internally between VR pin and VSS, and Rb is connected between V0 and VR. We determine V0 by two instructions, "Regulator Resistor Select" and "Set Reference Voltage".

**Table 13. Internal Rb/Ra Ratio depending on 3-bit Data (R2 R1 R0)**

	3-bit data settings (R2 R1 R0)							
	0 0 0	0 0 1	0 1 0	0 1 1	1 0 0	1 0 1	1 1 0	1 1 1
1 + (Rb/Ra)	2.3	3.0	3.7	4.4	5.1	5.8	6.5	7.2

Figure 24 Shows V0 voltage measured by adjusting internal regulator resistor ratio (Rb/Ra) and 6-bit electronic volume registers for each temperature coefficient at Ta = 25 °C.

**Figure 24. Electronic Volume Level (Temp. Coefficient = -0.075%/°C)**

### In Case of Using External Resistors, Ra and Rb (INTRS = "L")

When INTRS pin is "L", it is necessary to connect external regulator resistor Ra between VR and VSS, and Rb between V0 and VR.

Example: For the following requirements

1. LCD driver voltage,  $V_0 = 10V$
2. 6-bit reference voltage register = (1, 0, 0, 0, 0, 0)
3. Maximum current flowing Ra, Rb = 1  $\mu A$

From Eq.1

$$10 = \left(1 + \frac{R_b}{R_a}\right) \times V_{EV} [V] \text{ ----- (Eq.3)}$$

From Eq. 2

$$V_{EV} = \left(1 - \frac{63-32}{210}\right) \times 2.1 = 1.79 [V] \text{ ----- (Eq. 4)}$$

From requirement 3.

$$\frac{10}{R_a + R_b} = 1 [\mu A] \text{ ----- (Eq. 5)}$$

From equations Eq. 3, 4 and 5

$$R_a = 1.79 [M\Omega]$$

$$R_b = 8.21 [M\Omega]$$

Table 14 Shows the Range of V0 depending on the above Requirements.

**Table 14. The Range of V0**

	Electronic volume level				
	0	.....	32	.....	63
V0	8.21	.....	10.00	.....	11.73

### Voltage Follower Circuits

VLCD voltage (V0) is resistively divided into four voltage levels (V1, V2, V3 and V4), and those output impedance are converted by the Voltage Follower for increasing drive capability. Table 15 shows the relationship between V1 to V4 level and each duty ratio.

**Table 15. Voltage Follower Circuit**

LCD bias	V1	V2	V3	V4	Remarks
1/N	$(N-1)/N \times V_0$	$(N-2)/N \times V_0$	$2/N \times V_0$	$1/N \times V_0$	N = 4 to 11

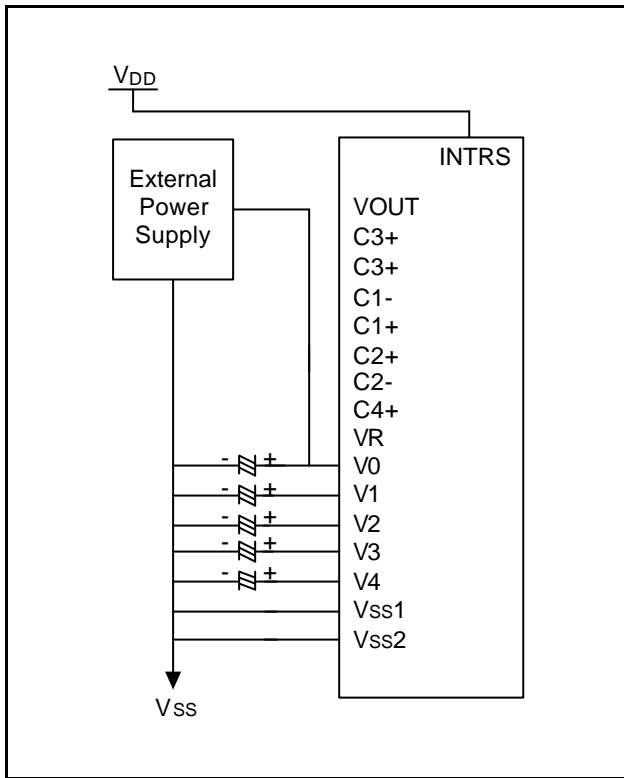

Figure 27. When Using only Voltage Follower Circuit (V/C: OFF, V/R: OFF, V/F: ON)

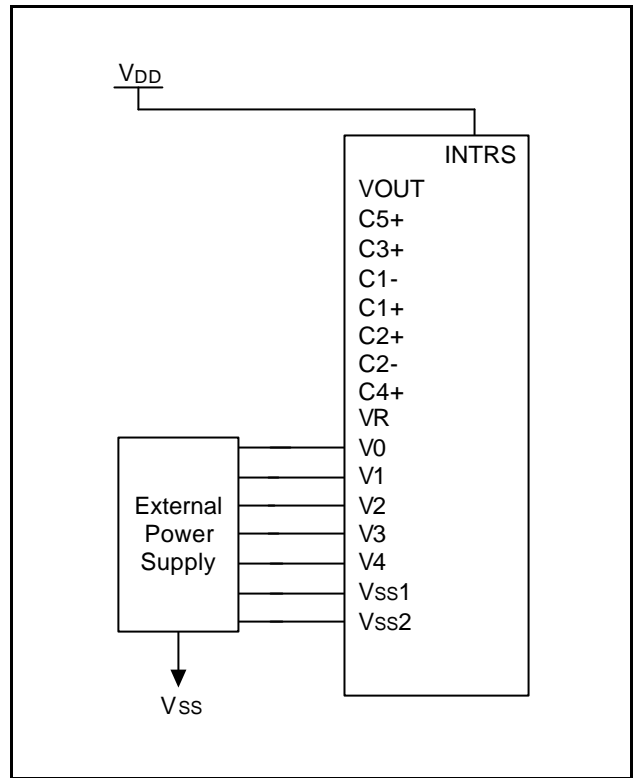

Figure 28. When Not Using all LCD Power Circuits (V/C: OFF, V/R: OFF, V/F: OFF)

## RESET CIRCUIT

Setting RESETB to "L" or Reset instruction can initialize internal function.  
When RESETB becomes "L", following procedure is occurred.

- Page address: 0
- Column address: 0
- Modify-read: OFF
- Display ON/OFF: OFF
- Initial display line: 0 (first)
- Initial COM0 register: 0 (COM0)
- Partial display duty ratio: 1/80
- Icon enable/Disable :0(disable)
- Reverse display ON/OFF: OFF (normal)
- n-line inversion register: 0 (disable)
- Entire display ON/OFF: OFF (normal)
- Power control register (VC, VR, VF) = (0, 0, 0)
- DC-DC step up: 3 times converter circuit = (0, 0)
- Regulator resistor select register: (R2, R1, R0) = (0, 0, 0)
- Reference voltage control register: (EV5, EV4, EV3, EV2, EV1, EV0) = (1, 0, 0, 0, 0, 0)
- LCD bias ratio: 1/10
- SHL select: OFF (normal)
- ADC select: OFF (normal)
- Oscillator status: OFF
- Power save mode: release

When RESET instruction is issued, following procedure is occurred.

- Page address: 0
- Column address: 0
- Modify-read: OFF
- Initial display line: 0 (First)
- Regulator resistor select register: (R2, R1, R0) = (0, 0, 0)
- Reference voltage control register (EV5, EV4, EV3, EV2, EV1, EV0) = (1, 0, 0, 0, 0, 0)
- Other instruction registers : Not Changed

While RESETB is "L" or reset instruction is executed, no instruction except read status can be accepted. Reset status appears at DB4. After DB4 becomes "L", any instruction can be accepted. RESETB must be connected to the reset pin of the MPU, and initialize the MPU and this LSI at the same time. The initialization by RESETB is essential before used.

## INSTRUCTION DESCRIPTION

Table 16. Instruction Table

Instruction	RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description
Read display data	1	1	Read data								Read data from DDRAM
Write display data	1	0	Write data								Write data into DDRAM
Read status	0	1	BUSY	ON	RES	0	0	0	0	1	Read the internal status
Set page address	0	0	1	0	1	1	P3	P2	P1	P0	Set page address
Set column address MSB	0	0	0	0	0	1	0	Y6	Y5	Y4	Set column address MSB
Set column address LSB	0	0	0	0	0	0	Y3	Y2	Y1	Y0	Set column address LSB
Set modify-read	0	0	1	1	1	0	0	0	0	0	Set modify-read mode
Reset modify-read	0	0	1	1	1	0	1	1	1	0	Release modify-read mode
Display ON/OFF	0	0	1	0	1	0	1	1	1	D	D = 0: display OFF D = 1: display ON
Set initial display line register	0	0	0	1	0	0	0	0	×	×	2-byte instruction to specify the initial display line to realize vertical scrolling
	0	0	×	S6	S5	S4	S3	S2	S1	S0	
Set initial COM0 register	0	0	0	1	0	0	0	1	×	×	2-byte instruction to specify the initial COM0 to realize window scrolling
	0	0	×	C6	C5	C4	C3	C2	C1	C0

Test instruction	0	0	1	1	1	1	×	×	×	×	<b><u>Don't use this instruction.</u></b>

NOTE: "×" is don't care.

**Read Display Data**

8-bit data from Display Data RAM specified by the column address and page address can be read by this instruction. As the column address is incremented by 1 automatically after each this instruction, the microprocessor can continuously read data from the addressed page. A dummy read is required after loading an address into the column address register. Display Data cannot be read through the serial interface.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	Read Data							

**Write Display Data**

8-bit data of display data from the microprocessor can be written to the RAM location specified by the column address and page address. The column address is incremented by 1 automatically so that the microprocessor can continuously write data to the addressed page.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	Write data							

Figure 29. Sequence for Writing Display Data

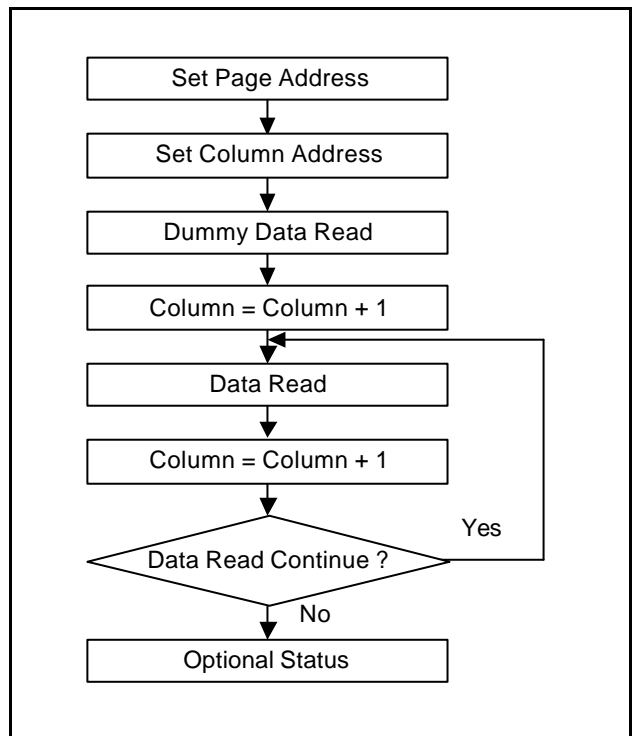

Figure 30. Sequence for Reading Display Data

**Read Status**

Indicates the internal status of the S6B0759

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BUSY	ON	RES	0	0	0	0	1

Flag	Description
BUSY	The device is busy when internal operation or reset. Any instruction is rejected until BUSY goes Low. 0: chip is active, 1: chip is being busy.
ON	Indicates display ON/OFF status. 0: display ON, 1: display OFF
RES	Indicates the initialization is in progress by RESETB signal. 0: chip is active, 1: chip is being reset.

**Set Page Address**

Sets the Page Address of display data RAM from the microprocessor into the Page Address register. Any RAM data bit can be accessed when its Page Address and column address are specified. Along with the column address, the Page Address defines the address of the display RAM to write or read display data. Changing the Page Address doesn't effect to the display status.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	1	P3	P2	P1	P0

P3	P2	P1	P0	Selected page	Description
0	0	0	0	0	Accessible pages for displaying dot-matrix display data.
0	0	0	1	1	
0	0	1	0	2	
:	:	:	:	:	
1	0	0	1	9	
1	0	1	0	10	Accessible page for displaying icons
1	0	1	1	11	Not accessible page.
1	1	0	0	12	Do not use these pages.
1	1	0	1	13	
1	1	1	0	14	
1	1	1	1	15	

**Set Column Address**

Sets the Column Address of display RAM from the microprocessor into the column address register. Along with the Page Address, the column address defines the address of the display RAM to write or read display data. When the microprocessor reads or writes display data to or from display RAM, Column Addresses are automatically incremented.

**Set Column Address MSB**

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	0	Y6	Y5	Y4

**Set Column Address LSB**

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	Y3	Y2	Y1	Y0

Y6	Y5	Y4	Y3	Y2	Y1	Y0	Selected column address
0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	1
0	0	0	0	0	1	0	2
:	:	:	:	:	:	:	:
:	:	:	:	:	:	:	:

1	1	1	1	1	0	1	125
1	1	1	1	1	1	0	126
1	1	1	1	1	1	1	127

**Set Modify-Read**

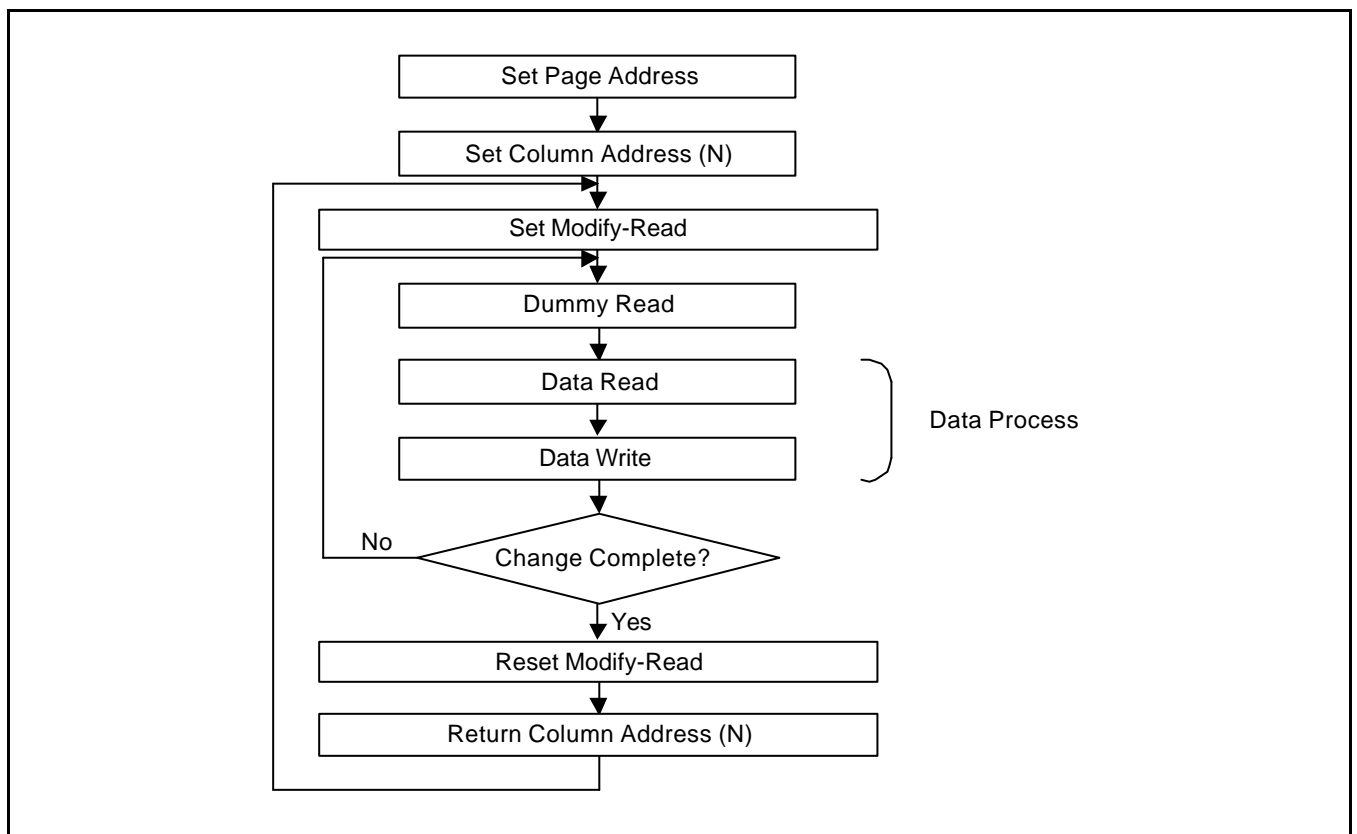

This instruction stops the automatic increment of the column address by the read display data instruction, but the column address is still increased by the Write display data instruction. And it reduces the load of microprocessor when the data of a specific area is repeatedly changed during cursor blinking or others. This mode is canceled by the reset Modify-read instruction.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	0	0

**Reset Modify-Read**

This instruction cancels the Modify-read mode, and makes the column address return to its initial value just before the set Modify-read instruction is started.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	1	1	1	0

**Figure 31. Sequence for Cursor Display**

**Display ON/OFF**

Turns the display ON or OFF

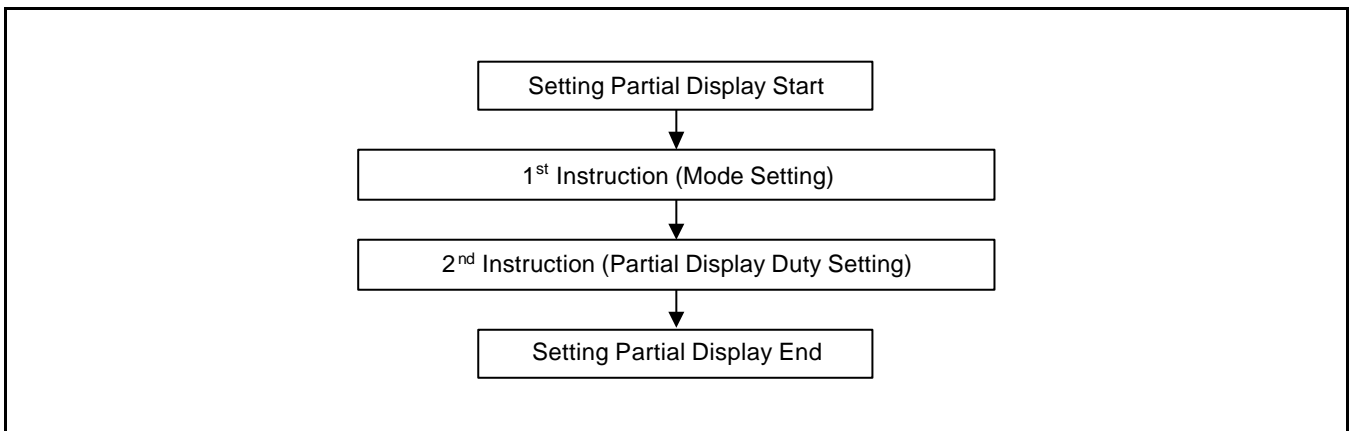

Figure 34. Sequence for Setting Partial Display

### Set N-line Inversion Register

Sets the inverted line number within range of 3 to 33 to improve the display quality by controlling the phase of the internal LCD AC signal (Internal M) by using the 2-byte instruction.

The DC bias problem could be occurred if K is even number. So, we recommend customers to set K to be odd number. K:D/N D: The number of display duty ratio(D is selectable by customers)

N: N for N-line inversion(N is selectable by customers).

#### The 1<sup>st</sup> Instruction

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	0	1	1	×	×

#### The 2<sup>nd</sup> Instruction

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	×	×	×	N4	N3	N2	N1	N0

N4	N3	N2	N1	N0	Selected n-line inversion
0	0	0	0	0	0-line inversion (frame inversion)
0	0	0	0	1	3-line inversion
0	0	0	1	0	4-line inversion
:	:	:	:	:	:
1	1	1	0	1	31-line inversion
1	1	1	1	0	32-line inversion
1	1	1	1	1	33-line inversion

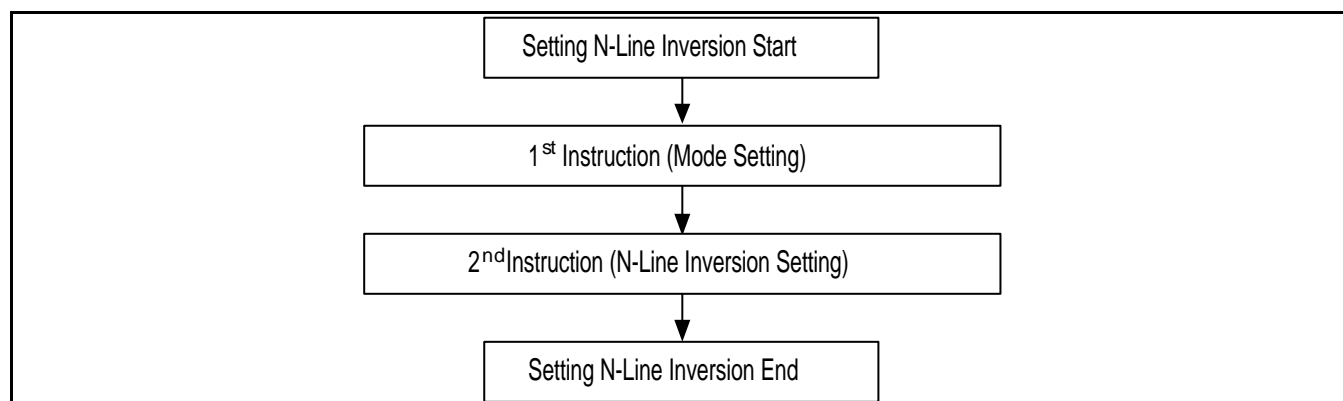

Figure 35. Sequence for Setting Partial Display

**Release N-line Inversion**

Returns to the frame inversion condition from the n-line inversion condition.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	1	0	0

**Reverse Display ON/OFF**

Reverses the display status on LCD panel without rewriting the contents of the display data RAM.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	1	1	REV

REV	RAM bit data = "1"	RAM bit data = "0"
0 (normal)	LCD pixel is illuminated.	LCD pixel is not illuminated.
1 (reverse)	LCD pixel is not illuminated.	LCD pixel is illuminated.

**Entire Display ON/OFF**

Forces the whole LCD points to be turned on regardless of the contents of the display data RAM. At this time, the contents of the display data RAM are held. This instruction has priority over the reverse display ON/OFF instruction.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	1	0	EON

EON	RAM bit data = "1"	RAM bit data = "0"
0 (normal)	LCD pixel is illuminated.	LCD pixel is not illuminated.
1 (entire)	LCD pixel is illuminated.	LCD pixel is illuminated.

**Icon enable/disable**

Allows the icon driver circuit to be enabled or disabled, thus changing the duty ratio setting.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	0	1	Icon
I		Duty Ratio Range							
0 (disable)		1/16 to 1/80							
1 (enable )		1/17 to 1/81							

### Power Control

Selects one of eight power circuit functions by using 3-bit register. An external power supply and part of internal power supply functions can be used simultaneously.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	0	1	VC	VR	VF

VC	VR	VF	Status of internal power supply circuits
0			Internal voltage converter circuit is OFF.
1			Internal voltage converter circuit is ON.
	0		Internal voltage regulator circuit is OFF.
	1		Internal voltage regulator circuit is ON.
		0	Internal voltage follower circuit is OFF.
		1	Internal voltage follower circuit is ON.

### Select DC-DC Step-up

Selects one of 4 DC-DC step-up to reduce the power consumption by this instruction. It is very useful to realize the partial display function.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	1	0	0	1	DC1	DC0

DC1	DC0	Selected DC-DC converter circuit
0	0	3 times boosting circuit
0	1	4 times boosting circuit
1	0	5 times boosting circuit
1	1	6 times boosting circuit

### Regulator Resistor Select

Selects resistance ratio of the internal resistor used in the internal voltage regulator. See voltage regulator section in power supply circuit. Refer to Table .

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	0	0	R2	R1	R0

R2	R1	R0	[Rb/Ra] ratio
0	0	0	Small
0	0	1	:
:	:	:	:
1	1	0	:
1	1	1	Large

**Set Electronic Volume Register**

Consists of 2-byte instruction

The 1<sup>st</sup> instruction sets electronic volume mode, the 2<sup>nd</sup> one updates the contents of electronic volume register. After second instruction, electronic volume mode is released.

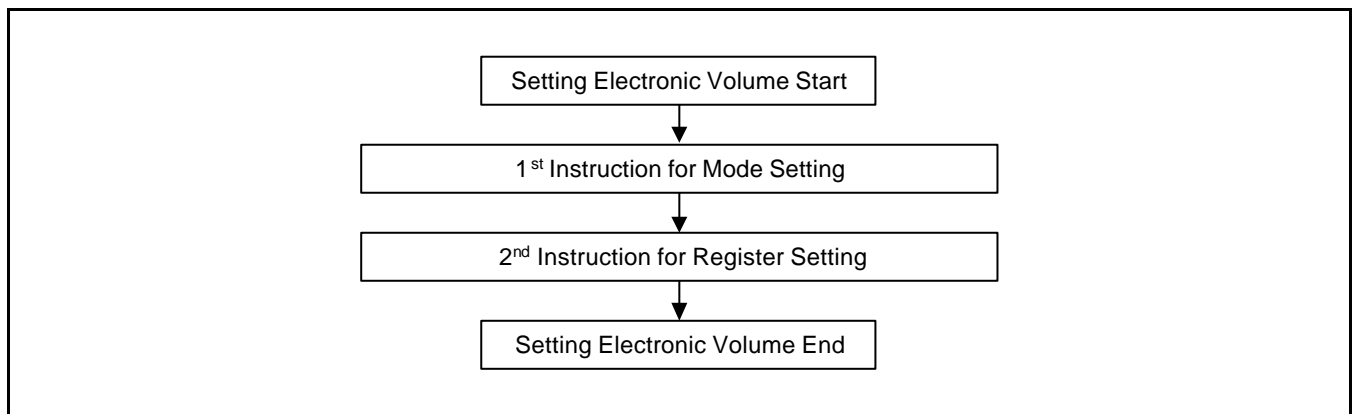

**The 1<sup>st</sup> Instruction**

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	0	0	0	0	0	1

**The 2<sup>nd</sup> Instruction**

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	×	×	EV5	EV4	EV3	EV2	EV1	EV0

EV5	EV4	EV3	EV2	EV1	EV0	Reference voltage (a)
0	0	0	0	0	0	0
0	0	0	0	0	1	1
:	:	:	:	:	:	:
:	:	:	:	:	:	:
1	1	1	1	1	0	62
1	1	1	1	1	1	63

**Figure 36. Sequence for Setting the Electronic Volume**

**Select LCD Bias**

Selects LCD Bias ratio of the voltage required for driving the LCD.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	1	0	B2	B1	B0

B2	B1	B0	Selected LCD bias
0	0	0	1/4
0	0	1	1/5
0	1	0	1/6
0	1	1	1/7
1	0	0	1/8
1	0	1	1/9
1	1	0	1/10
1	1	1	1/11

**SHL Select**

COM output scanning direction is selected by this instruction which determines the LCD driver output status.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	0	0	SHL	×	×	×

SHL = 0: normal direction (COM0 → COM79)

SHL = 1: reverse direction (COM79 → COM0)

**ADC Select**

Changes the relationship between RAM column address and segment driver. The direction of segment driver output pins could be reversed by software. This makes IC layout flexible in LCD module assembly.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	0	0	ADC

ADC = 0: normal direction (SEG0 → SEG127)

ADC = 1: reverse direction (SEG127 → SEG0)

**Set Data Direction & Display Data Length (3-Pin SPI Mode)**

Consists of two bytes instruction.

This command is used in 3-Pin SPI mode only(PS0 = "L" and PS1 = "L"). It will be two continuous commands, the first byte control the data direction(write mode only) and inform the LCD driver the second byte will be number of data bytes will be write. When RS is not used, the Display Data Length instruction is used to indicate that a specified number of display data bytes are to be transmitted. The next byte after the display data string is handled as command data.

**The 1<sup>st</sup> Instruction: Set Data Direction (Only Write Mode)**

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
x	x	1	1	1	0	1	0	0	0

**The 2<sup>nd</sup> Instruction: Set Display Data Length (DDL) Register**

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
x	x	D7	D6	D5	D4	D3	D2	D1	D0

D7	D6	D5	D4	D3	D2	D1	D0	Display Data Length

1	1	1	1	1	1	1	0	255
1	1	1	1	1	1	1	1	256

**Oscillator ON Start**

This instruction enables the built-in oscillator circuit.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	1	0	1	1

**Reset**

This instruction resets initial display line, column address, page address, and common output status select to their initial status, but dose not affect the contents of display data RAM. This instruction cannot initialize the LCD power supply, which is initialized by the RESETB pin.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	1	0

**Power Save**

The S6B0759 enters the Power Save status to reduce the power consumption to the static power consumption value and returns to the normal operation status by the following instructions.

**Set Power Save Mode**

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	1	0	0	P

P = 0: standby mode

P = 1: sleep mode

**Release Power Save Mode**

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	0	1

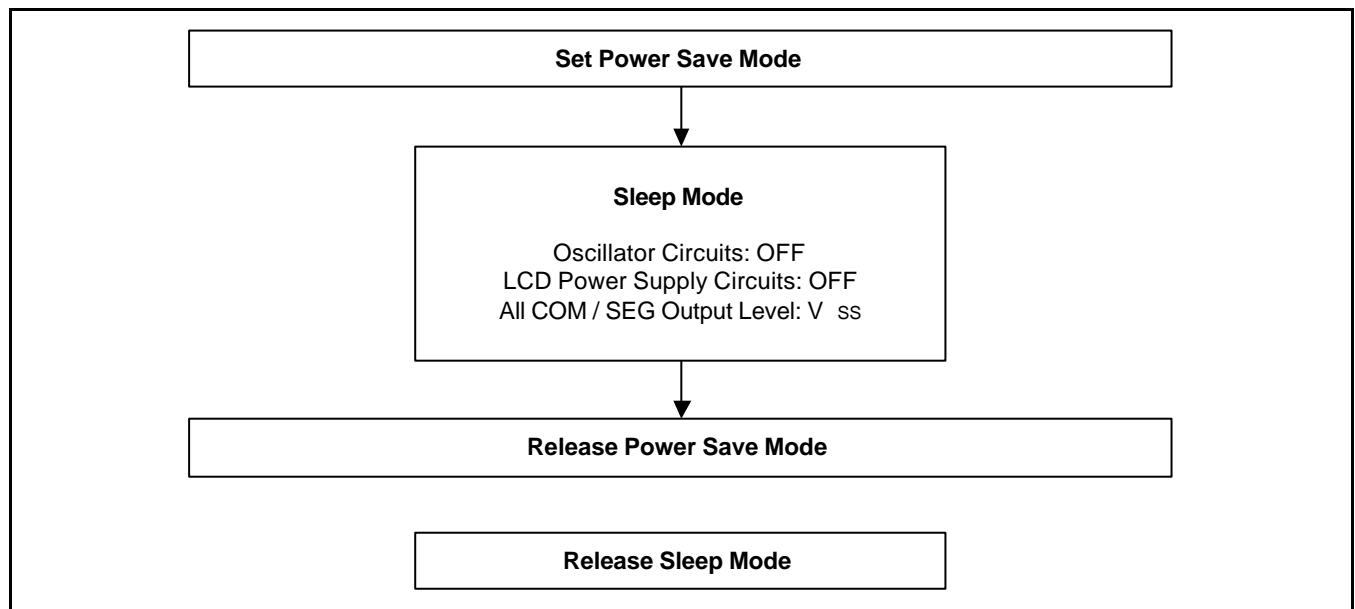

Figure 37. Power Save Routine

**NOP**

Non Operation Instruction

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0

## SPECIFICATIONS

## ABSOLUTE MAXIMUM RATINGS

Table 17. Absolute Maximum Ratings

 $(V_{SS} = 0V)$ 

Parameter	Symbol	Rating	Unit
Supply voltage range	$V_{DD}$	- 0.3 to + 7.0	V
	$V_0, V_{OUT}$	- 0.3 to + 17.0	V
	$V_1, V_2, V_3, V_4$	- 0.3 to $V_0 + 0.3$	V
External reference voltage	$V_{EXT}$	+ 0.3 to $V_{DD}$	V
Input voltage range	$V_{IN}$	- 0.3 to $V_{DD} + 0.3$	V
Operating temperature range	$T_{OPR}$	- 40 to + 85	°C
Storage temperature range	$T_{STR}$	- 55 to + 125	°C

## NOTES:

- $V_{DD}$ ,  $V_0$ ,  $V_{OUT}$ ,  $V_1$  to  $V_4$ ,  $V_{EXT}$  and  $V_{CI}$  are based on  $V_{SS} = 0V$ .
- Voltage  $V_{OUT} \geq V_0 \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_{SS}$  must always be satisfied.
- If supply voltage exceeds its absolute maximum range, this LSI may be damaged permanently. It is desirable to use this LSI under electrical characteristic conditions during general operation. Otherwise, this LSI may malfunction or reduced LSI reliability may result.

## DC CHARACTERISTICS

Table 18. DC Characteristics

(V<sub>SS</sub> = 0V, V<sub>DD</sub> = 1.8 to 3.3V, Ta = -40 to 85°C)

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Pin used	
Operating voltage (1)	V <sub>DD</sub>		1.8	-	3.3	V	V <sub>DD</sub> (1)	
Operating voltage (2)	V <sub>0</sub>		4.0	-	15.0	V	V <sub>0</sub> (2)	
Input voltage	High	V <sub>IH</sub>	0.8V <sub>DD</sub>	-	V <sub>DD</sub>	V	(3)	
	Low	V <sub>IL</sub>	V <sub>SS</sub>	-	0.2V <sub>DD</sub>			
Output voltage	High	V <sub>OH</sub>	I <sub>OH</sub> = -0.5mA	0.8V <sub>DD</sub>	-	V <sub>DD</sub>	V	(4)
	Low	V <sub>OL</sub>	I <sub>OL</sub> = 0.5mA	V <sub>SS</sub>	-	0.2V <sub>DD</sub>		
Input leakage current	I <sub>IL</sub>	V <sub>IN</sub> = V <sub>DD</sub> or V <sub>SS</sub>	- 1.0	-	+ 1.0	μA	(3)	
Output leakage current	I <sub>OZ</sub>	V <sub>IN</sub> = V <sub>DD</sub> or V <sub>SS</sub>	- 3.0	-	+ 3.0	μA	(5)	
LCD driver ON resistance	R <sub>ON</sub>	Ta = 25°C, V <sub>0</sub> = 8V	-	2.0	3.0	kΩ	SEg <sub>n</sub> COM <sub>n</sub> (6)	
Frame frequency	f <sub>FR</sub>	Ta = 25°C	70	85	100	Hz	(7)	
Voltage converter input voltage	VCI	x 3	1.8	-	3.6	V	VCI

**Dynamic Current Consumption (1) when An External Power Supply is used.****Table 19. Dynamic Current 1 (External Power)** $(V_{DD} = 2.4V, T_a = 25^{\circ}C)$ 

Item	Symbol	Condition	Min	Typ	Max	Unit	Pin used
Dynamic current consumption (1)	$I_{DD1}$	$V_0 - V_{SS}$ 12.0V, duty = 1/81 (Display Off)	-	7.5	10	$\mu A$	(10)
		$V_0 - V_{SS}$ 12.0V, duty = 1/81 (Display On , Checker Pattern)	-	10	15	$\mu A$	(10)

**Dynamic Current Consumption (2) when The Internal Power Supply is ON****Table 20. Dynamic Current 2 (Internal Power)** $(V_{DD} = 2.4V, T_a = 25^{\circ}C)$ 

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Pin used
Dynamic current consumption (2)	$I_{DD2}$	$V_0 - V_{SS}$ 12.0V, x5 boosting, duty = 1/81, normal mode (Display Off)	-	120	190	$\mu A$	(10)
		$V_0 - V_{SS}$ 12.0V, x5 boosting, duty = 1/81, normal mode (Display On , Checker Pattern)	-	210	300	$\mu A$	(10)

**Current Consumption during Power Save Mode****Table 21. Power Save Mode Current** $(V_{DD} = 2.4V, T_a = 25^{\circ}C)$ 

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Pin used
Sleep mode current	$I_{DDS1}$	During sleep	-	-	3	$\mu A$	(10)

Table 22. The Relationship between Oscillation Frequency and Frame Frequency

Duty ratio	Item	F <sub>CL</sub>	f <sub>osc</sub>
1/N	On-chip oscillator circuit is used	f <sub>FR</sub> × N	f <sub>FR</sub> × 4 × N

(f<sub>osc</sub>: oscillation frequency, f<sub>CL</sub>: display clock frequency, f<sub>FR</sub>: frame frequency, N = 17 to 81)

**NOTES:**

1. Though the wide range of operating voltages is guaranteed, a spike voltage change may affect the voltage assurance during access from the MPU.
2. In case of external power supply is applied.
3. CS1B, RS, DB0 to DB7, E\_RD, RW\_WR, RESETB, PS1, PS0, INTR, and REF.
4. DB0 to DB7
5. Applies when the DB0 to DB7 pins are in high impedance.
6. Resistance value when -0.1[mA] is applied during the ON status of the output pin SEGn or COMn.  
RON [kΩ] = ΔV[V]/0.1[mA] (ΔV : voltage change when -0.1[mA] is applied in the ON status.)
7. See Table for the relationship between oscillation frequency and frame frequency.
8. The voltage regulator circuit adjusts V0 within the voltage follower operating voltage range.
9. On-chip reference voltage source of the voltage regulator circuit to adjust V0.
10. Applies to the case where the on-chip oscillation circuit is used and no access is made from the MPU.  
The current consumption, when the built-in power supply circuit is ON or OFF.  
The current flowing through voltage regulation resistors(Rb and Ra) is not included.  
It does not include the current of the LCD panel capacity, wiring capacity, etc.

AC CHARACTERISTICS

Read/Write Characteristics (8080-series MP)

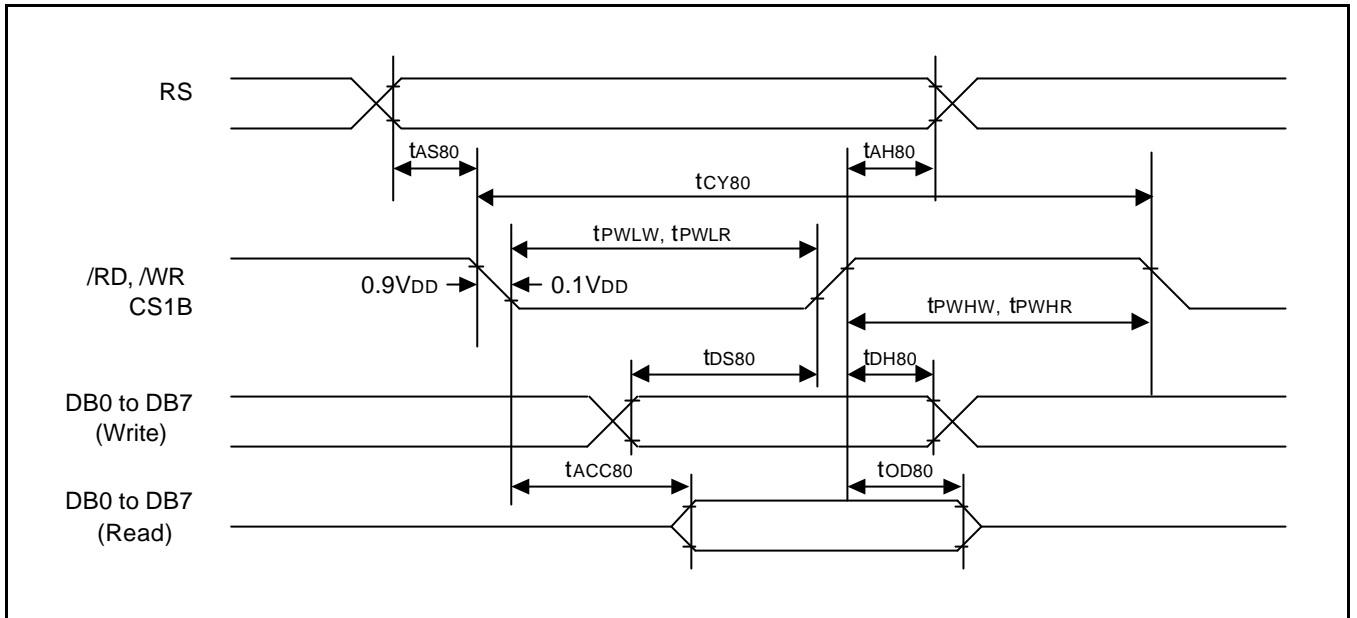

Figure 43. Read/Write Characteristics (8080-series MPU)

( $V_{DD} = 1.8$  to  $3.3V$ ,  $T_a = -40$  to  $+85^{\circ}C$ )

Item	Signal	Symbol	Condition	Min.	Max.	Unit
Address setup time	RS	$t_{AS80}$		0	-	ns
Address hold time		$t_{AH80}$		0	-	ns
System cycle time		$t_{CY80}$		1000	-	ns
Pulse width low for write	RW_WR (/WR)	$t_{PWLW}$		120	-	ns
Pulse width high for write		$t_{PWHW}$		120	-	ns
Pulse width low for read	E_RD (/RD)	$t_{PWL}$		240	-	ns
Pulse width high for read		$t_{PWH}$		120	-	ns
Data setup time	DB0 to DB7	$t_{DS80}$		80	-	ns
Data hold time		$t_{DH80}$		30	-	ns
Read access time		$t_{ACC80}$	CL = 100 pF	-	280	ns
Output disable time		$t_{OD80}$		10	200	

**NOTE:** The input signal rise time and fall time ( $t_R, t_F$ ) is specified at 15 ns or less.  
 Or  $(t_R + t_F) < (t_{CY80} - t_{PWLW} - t_{PWHW})$  for write,  $(t_R + t_F) < (t_{CY80} - t_{PWL} - t_{PWH})$  for read.

## Read/Write Characteristics (6800-series Microprocessor)

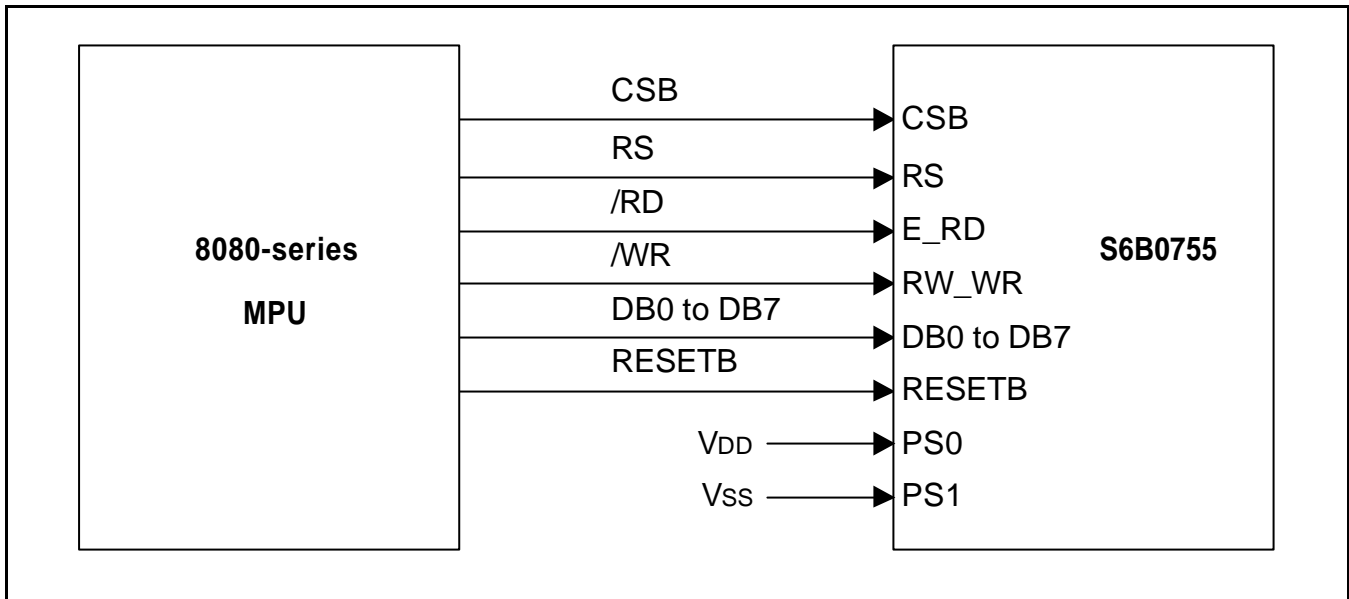

Figure 44. Read/Write Characteristics (6800-series Microprocessor)

( $V_{DD} = 1.8$  to  $3.3V$ ,  $T_a = -40$  to  $+85^{\circ}C$ )

Item	Signal	Symbol	Condition	Min.	Max.	Unit
Address setup time	RS	$t_{AS68}$		0	-	ns
Address hold time	RW	$t_{AH68}$		0	-	ns
System cycle time		$t_{CY68}$		500	-	ns
Enable width high for write	E_RD	$t_{EWHW}$		60	-	ns
Enable width low for write	(E)	$t_{EWLW}$		60	-	ns
Enable width high for read	E_RD	$t_{EWHR}$		120	-	ns
Enable width low for read	(E)	$t_{EWLR}$		60	-	ns
Data setup time	DB0 to DB7	$t_{DS68}$		30	-	ns
Data hold time		$t_{DH68}$		5	-	ns
Read access time		$t_{ACC68}$	$C_L = 100$ pF	-	60	ns
Output disable time		$t_{OD68}$		10	50	

**NOTE:** The input signal rise time and fall time ( $t_R$ ,  $t_F$ ) is specified at 15 ns or less.

Or  $(t_R + t_F) < (t_{CY80} - t_{EWHW} - t_{EWLW})$  for write,  $(t_R + t_F) < (t_{CY80} - t_{EWHR} - t_{EWLR})$  for read.

Serial Interface Characteristics

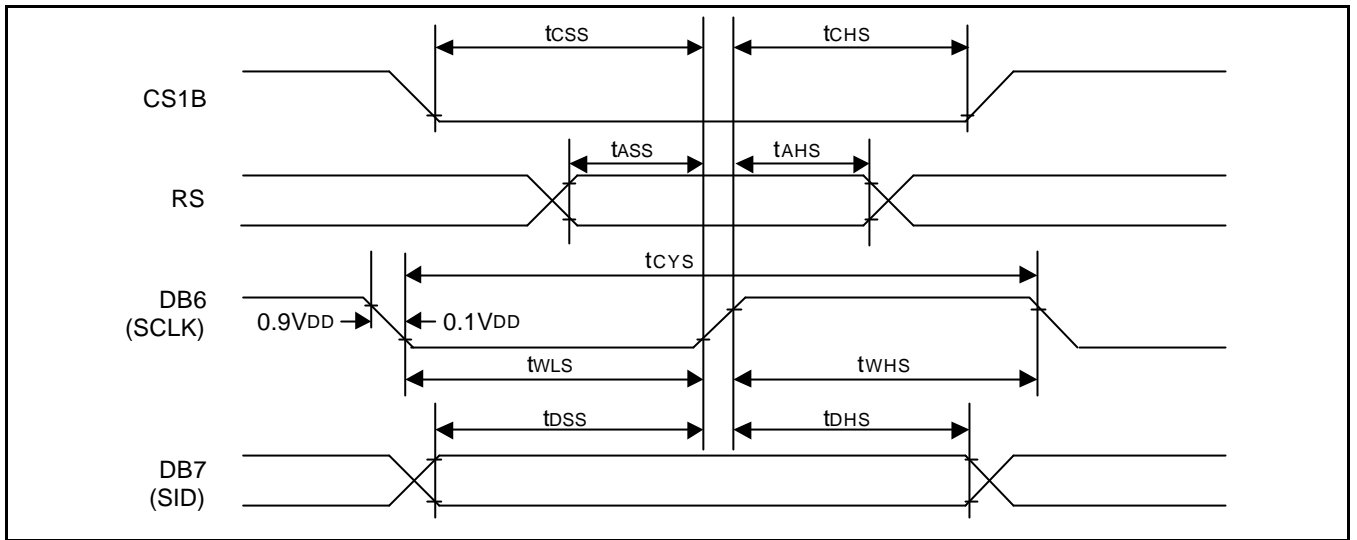

Figure 45. Serial Interface Characteristics

(V<sub>DD</sub> = 1.8 to 2.6V, T<sub>a</sub> = -40 to +85°C)

Item	Signal	Symbol	Condition	Min.	Max.	Unit
Serial clock cycle	DB6 (SCLK)	t <sub>SCY</sub>		111	-	ns
SCLK high pulse width		t <sub>SHW</sub>		60	-	
SCLK low pulse width		t <sub>SLW</sub>		60	-	
Address setup time	RS	t <sub>ASS</sub>		60	-	ns
Address hold time		t <sub>AHS</sub>		60	-	
Data setup time	DB7 (SID)	t <sub>DSS</sub>		60	-	ns
Data hold time		t <sub>DHS</sub>		60	-	
CS1B setup time	CS1B	t <sub>CSS</sub>		60	-	ns
CS1B hold time		t <sub>CHS</sub>		60	-	

(V<sub>DD</sub> = 2.6V to 3.3V, T<sub>a</sub> = -40 to +85°C)

Item	Signal	Symbol	Condition	Min.	Max.	Unit
Serial clock cycle	DB6 (SCLK)	t <sub>SCY</sub>		58.8	-	ns
SCLK high pulse width		t <sub>SHW</sub>		30	-	
SCLK low pulse width		t <sub>SLW</sub>		30	-	
Address setup time	RS	t <sub>ASS</sub>		30	-	ns
Address hold time		t <sub>AHS</sub>		30	-	
Data setup time	DB7 (SID)	t <sub>DSS</sub>		30	-	ns
Data hold time		t <sub>DHS</sub>		30	-	
CS1B setup time	CS1B	t <sub>CSS</sub>		30	-	ns
CS1B hold time		t <sub>CHS</sub>		30	-	

NOTE: The input signal rise time and fall time (t<sub>R</sub>, t<sub>F</sub>) is specified at 15 ns or less.

## Reset Input Timing

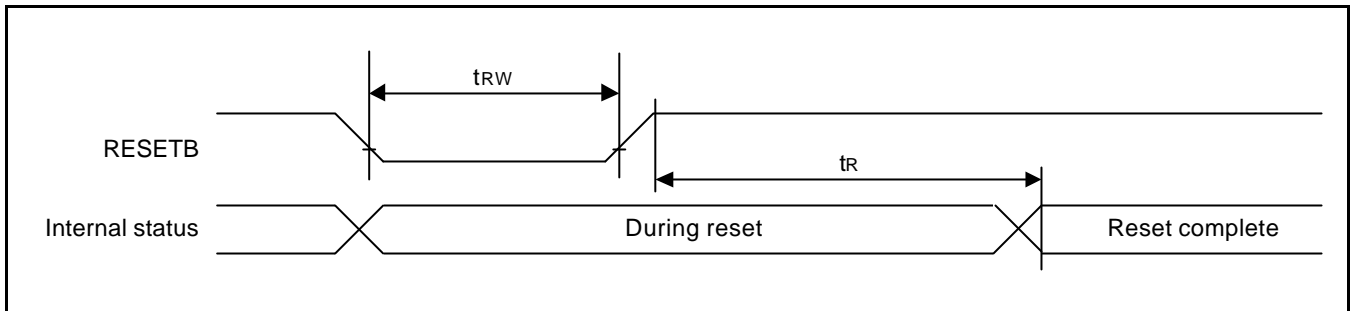

Figure 46. Reset Input Timing

( $V_{DD} = 1.8$  to  $3.3V$ ,  $T_a = -40$  to  $+85^\circ C$ )

Item	Signal	Symbol	Condition	Min.	Max.	Unit
Reset low pulse width	RESETB	$t_{RW}$		1000	-	ns
Reset time	-	$t_R$		-	1000	ns
