

Vikuiti[™] Reflective Display Film—Black (RDF-B) Vikuiti[™] Reflective Display Film—Clear (RDF-C) Vikuiti[™] Transflective Display Film (TDF)

Transflective and reflective mode LCDs can now be enhanced to improve readability and style. These films are based on Vikuiti's proprietary reflective polarizer and diffuse adhesive technologies, and allow direct replacement of the bottom polarizer assembly used in conventional displays.

Feature	Advantage	Benefit
Reflective Polarizer	1. Replaces standard bottom polarizer	No additional film cost
	2. Nearly doubles reflected brightness across the complete viewing range	 Low light readability eliminates and/or reduces backlight need and extends battery charge and backlight life
	3. Illuminated images in backlit mode	 Unique display appearance reduces the size of the required electroluminescent backlight
	4. Enables colored characters	 Allows unique styling of the characters when used with metallic reflectors or colored electroluminescent backlights
Diffuse Adhesive	1. Small particle size	Provides a "smooth" or "creamy" appearance
No Transflector	1. Single film construction	Reduces total LCD module thickness and weight

The following three products can meet your specific display needs:

LCD Mode	Vikuiti Product Type	Product Application	Unique Feature
Reflective	RDF- B	Calculators, instrumentation, appliances	High contrast
Transflective or Reflective	RDF-C	Palmtop PC, cellular phones, pagers, watches/clocks	Enables colored characters, illuminated backlit image*
Transflective	TDF	Palmtop PC, cellular phones, pagers, watches/clocks	Illuminated backlit image*

*Example

The following drawings detail each product construction:

	Vikuiti [™] RDF-B	Vikuiti [™] TDF	Vikuiti [™] RDF-C
Color of the adhesive side		Bright Diffuse Silver	
Color of the backside	Black	Gray (50% Neutral Density)	Clear
10° Contrast Ratio*	40:1	40:1	40:1
180° Peel Force (adhesive to LCD glass)	720 g/in.		
Reflectance	45%	45%	45%
Transmittance	0%	21.5%	43%
Normalized white state brightness**	5:1		
Product format	330 x 550mm Sheets Transmission Axis Along 550mm Dimension		
Thickness with liners	273 micrometers		260 micrometers
Thickness without liners	171 micrometers		158 micrometers

*3M 10° Contrast Ratio Test Method.

Vikuiti film sample is painted black (3MTM ScotchcalTM 3905 black screen printing ink, #75-5239-0502-6) on the backside and oriented in the test fixture (see drawing on left) for sequential maximum and minimum on-axis reflected luminance with 10° incident illumination. The ratio of the maximum and minimum values gives the 10° contrast ratio.

****3M Normalized White State Brightness Test Method.** Vikuiti film sample is oriented in test fixture (see drawing on left) for maximum on-axis reflected luminance with 10° incident illumination. This means the two polarizers are oriented 90° with respect to each other. Conventional reflective/transflective displays use absorbing polarizers along with visibly textured surfaces to manage both polarization and light scattering. This mode of operation is illustrated below for both the ambient and backlit illumination conditions for a normally white cell.

Backlit Illumination Conventional Display (Transflector only)

- Bottom polarizer transmits linearly polarized light by absorption of orthogonal polarization.
 LC layer rotates incident polarization 90°.
- 4. Light transmits through top polarizer

- 1. Backlight illumination passes through
- transflector layer and is scattered. 2. Bottom polarizer transmits linearly polarized light by absorption of orthogonal
- polarization.
- 3. LC layer transmits light with no rotation.
- 4. Light is absorbed by top polarizer giving dark state.

In either ambient or backlit mode, multiple passes through the absorbing polarizer decrease brightness and impart a greenish tint to the display. In addition, the textured reflector/transflector, used for light scattering, gives the entire display a grainy appearance.

Based on the Vikuiti product construction, absorption is minimized using a reflective polarizer rather than a dichroic polarizer. The following illustrations highlight both ambient and backlit illumination for a normally white cell with the Vikuiti product.

Backlit Illumination Vikuiti RDF-C, Vikuiti TDFVoltage OFF/Dark StateVoltage ON/White State

- 1. Backlight illumination passes through opaque/colored layer.
- Vikuiti reflective polarizer transmits linearly polarized light by reflection of orthogonal polarization.
- 3. Light is diffused by adhesive layer.
- 4. LC layer rotates incident polarization 90°.
- 5. Light is absorbed by top polarizer giving dark state.

- 1. Backlight illumination passes through opaque/colored layer.
- Vikuiti reflective polarizer transmits linearly polarized light by reflection of orthogonal polarization.
- 3. Light is diffused by adhesive layer.
- 4. LC layer does not rotate polarization.
- 5. Light is transmitted by top polarizer giving white state.

Note: The above drawings illustrate that Vikuiti RDF-B, Vikuiti RDF-C and Vikuiti TDF are *aligned* with the transmission axis of the display top polarizer, as opposed to a conventional display where the polarizers are orthogonal.

Illuminated images can now be created when Vikuiti TDF and Vikuiti RDF-C are backlit. Additional styling can be achieved when Vikuiti RDF-C is used in conjunction with colored films or electroluminescent backlights.

Ambient Mode Optical Performance

Vikuiti TDF and Vikuiti RDF films nearly double the reflected light. The above graph illustrates the imageenhancing characteristics of Vikuiti RDF/TDF films. Their unique reflective polarizer film and high performance diffusing adhesive dramatically improves brightness levels at nearly all viewing angles and ambient lighting conditions.

Optical Performance to Environmental Conditions

Film samples have withstood the following environmental tests without any appreciable deterioration in visible appearance, physical integrity or optical performance. Over the entire test duration all optical properties maintained specified performance criteria. All samples were roller laminated to conventional Fisher Scientific microscope slides precleaned with isopropyl alcohol.

Description	Condition	Duration
High Temperature	+85°C	600 hours
Low Temperature	-35°C	600 hours
High Temp/Humidity	+65°C at 95% R.H.	600 hours
Thermal Shock	One hour at -35°C followed by one hour at +85°C	200 cycles
